

ERS

extremely fast universal 48-pindrive programmer

• extremely fast programming, one of the fastest programmers in this category. Programs 64-Mbit NOR Flash memory less than 9 sec. and 1Gbit NAND Flash less than 70 sec. 48-pins powerful pindrivers in-circuit programming • dual connection to PC: USB (up to 480 Mbit/s) or parallel (printer) port

NC.				
device	Size [bits]	Program+Verify [s]

## **Features**

#### **GENERAL**

·BeeProg2 is next generation of USB/LPT-compatible, Windows 98/ME/NT/2000/XP/2003/XPx64/Vista/7 based ELNEC universal programmers, built to meet the strong demand of the small manufacturing and developers community for the fast and reliable universal programmer.

Supports all types of the silicon technologies found in the programmable devices of today and tomorrow without family-specific modules. You can be sure that new device support will require only a software update and (if necessary) a simple package convertor (programming adapter), therefore minimizing ownership costs. ·Using built-in in-circuit serial programming (ISP) connector, the programmer is able to program ISP capable chips in circuit.

 BeeProg2 isn't only a programmer, but also a tester of TTL/CMOS logic ICs and memories. Furthermore, it allows generation of user-definable test pattern sequences

· Provides very competitive price coupled with excellent hardware design for reliable programming. Probably the best "value for the money" programmer in its class.

.Very fast programming due to high-speed FPGA driven hardware and execution of time-critical routines inside of the programmer. At least as fast as competitors in this category, for many chips much faster than most competitors. As a result, when used in production this one-socketprogrammer waits for an operator, and not the other way round.

 BeeProg2 interfaces to the IBM PC compatible, portable or desktop personal computers through USB (2.0/1.1) port or any standard parallel (printer) port. Programmer can utilize power of both USB high-speed port and IEEE1284 (ECP/EPP) high-speed parallel port. Support of both USB/LPT port connection gives you the choice to connect the BeeProg programmer to any PC, from latest notebook to older desktop without USB port

•FPGA based totally reconfigurable 48 powerful TTL pin-drivers provide H/L/pull\_up/pull\_down and read capability for each pin of socket. Advanced pin-drivers incorporate high-quality high-speed circuitry to deliver signals without overshoot or ground bounce for all supported devices. Improved pin drivers operate down to 1.8V so you'll be ready to program the full range of today's advanced low-voltage devices.

#### HARDWARE

. The programmer performs device insertion test (wrong or backward position) and contact check (poor contact pin-to-socket) before it programs each device. These capabilities, supported by over-current protection and signature-byte check help prevent chip damage due to operator error.

 Built-in protection circuits eliminate damage of programmer and/or
 programmed device due to environment or operator failure. All the inputs of the BeeProg2 programmer, including the ZIF socket, connection to PC and power supply input, are protected against ESD up to 15kV.

 The BeeProg2 programmer performs programming verification at the marginal level of supply voltage, which, obviously, improves programming yield, and guarantees long data retention.

 Various socket converters are available to handle device in PLCC, JLCC, SOIC, SDIP, SOP, PSOP, SSOP, TSOP, TSOPII, TSSOP, QFP, PQFP, TQFP, VQFP, QFN (MLF), SON, BGA, EBGA, FBGA, VFBGA, UBGA, FTBGA, LAP, CSP, SCSP, LQFP, MQFP, HVQFN, QLP, QIP and other packages

#### SOFTWARE

·Programmer is driven by an easy-to-use control program with pull-down menu, hot keys and on-line help. Selecting of device is performed by its class, by manufacturer or simply by typing a fragment of vendor name and/or part number

Standard device-related commands (read, blank check, program, verify, erase) are boosted by some test functions (insertion test, signature-byte check), and some special functions (auto-increment, production mode -start immediately after insertion of chip into socket).

-All known data formats are supported. Automatic file format detection and conversion during loading of file.

 The rich-featured auto-increment function enables one to assign individual serial numbers to each programmed device - or simply increments a serial number, or the function enables one to read serial numbers or any programmed device identification signatures from a file.

 The software also provides a many information about programmed device. As a special, the drawing of all available packages are provided. The software provides also explanation of chip labelling (the meaning of prefixes and suffixes at the chips) for each supported chip

 The software provides a full information for ISP implementation: Description of ISP connector pins for currently selected chip, recommended target design around in-circuit programmed chip and other necessary information.

 The remote control feature allows to be PG4UW software flow controlled. by other application - either using .BAT file commands or using DLL file. DLL file, examples (C/PAS/VBASIC/.NET) and manual are part of standard software delivery. • Jam files of JEDEC standard JESD-71 are interpreted by Jam Player. Jam

files are generated by design software which is provided by manufacturer of respective programmable device. Chips are programmer in-ZIF or through ISP connector (IEEE 1149.1 Joint Test Action Group (JTAG) interface). • VME files are interpreted by VME Player. VME file is a compressed binary

variation of SVF file and contains high-level IEEE 1149.1 bus operations. SVF files are interpreted by SVF Player. SVF file (Serial Vector Format) contains high-level IEEE 1149.1 bus operations. SVF files are generated by design software which is provided by manufacturer of respective programmable device. Chips are programmed in-ZIF or through ISP connector (IEEE 1149.1 Joint Test Action Group (JTAG) interface). VME files are generated by design software which is provided by manufacturer of respective programmable device. Chips are programmer in-ZIF or through ISP connector (IEEE 1149.1 Joint Test Action Group (JTAG) interface). Multiple devices are possible to program and test via JTAG chain: JTAG chain (ISP-Jam) or JTAG chain (ISP-VME).

Attaching of more BeeProg2 programmers to the same PC (through USB port) is achieved a powerful multiprogramming system, which support as many chips, as are supported by BeeProg2 programmer and without obvious decreasing of programming speed. It is important to know, there is a concurrent multiprogramming - each programmer works independently and each programmer can program different chip, if necessary.

## BeeProg2 technical specification

## HARDWARE

**Base unit, DACs** 

 USB 2.0 high-spped compatible port, up to 480 Mbit/s transfer rate
 FPGA based IEEE 1284 slave printer port, up to 1MB/s transfer rate on-board intelligence: powerful microprocessor and FPGA based state machine
 three D/A converters for VCCP, VPP1, and VPP2, controllable rise and fall time

VCCP range 0..8V/1A • VPP1, VPP2 range 0..26V/1A • auto-calibration

 self-test capability • protection against surge and ESD on power supply input, parallel port connection

#### ZIF socket, pin driver

21F Sucket, pin unver • 48-pin DIL ZIF (Zero Insertion Force) socket accepts both 300/600 mil devices up to 48-pin • pin-drivers: 48 universal • VCCP/VP1/VP2 can be connected to each pin • perfect ground for each pin • FPGA based TTL driver provides H, L, CLK, pull-up, pull-down on all pin-driver pins • analog pin-driver output level selectable from 1.8 V up to 26V

· current limitation, over-current shutdown, power failure shutdown ESD protection on each pin of socket (IEC1000-4-2: 15kV air, 8kV contact) · continuity test: each pin is tested before every programming operation

#### **ISP** connector

 20-pin male type with miss-insertion lock • 6 TTL pin-drivers, provides H, L, CLK, pull-up, pull-down; level H selectable from 1.8V up to 5V to handle all (low voltage including) devices. • 1.x VCCP voltage (range 2V, r/v100mÅ), can be applied to 2 pins • programmed chip voltage (VCCP) with both source/sink capability and voltage sense • larget system supply voltage (range 2V, 6//250mÅ) 1x VPP voltage (range 2V.25V/50mÅ), can be applied to 6 pins • ESD protection on each pin of ISP connector (IEC1000-4-2: 15kV air, 8kV contact) two output signals, which indicate state of work result = LED OK and LED Error (active level; min 1.8V) • input signal, switch YES! equivalent (active level; max 0.8V)

#### **Device sup**

#### **Programmer, in ZIF socket**

 EPROM: NMOS/CMOS, 2708\*, 27xxx and 27Cxxx series, with 8/16 bit data width, full support for LV series • EEPROM: NMOS/CMOS, 28xxx, 28Cxxx, 27EExxx series, with 8/16 bit data width • Flash EPROM: 28Fxxx, 29Cxxx, 29Fxxx, 29BVxxx, 29LVxxx, 29Wxxx, 49Fxxx series, Samsung's K8Fxxxx, K8Cxxxx, K8Sxxxx, K8Pxxxx series, from 256Kbit to 1Gbit, with 8/16 bit data width, full support for LV series • Serial E(E)PROM: Serial E(E)PROM: 11LCxxx, 24Cxxx, 24Fxxx, 25Cxxx, 59Cxxx, 85xxx, 93Cxxx, NVM3060, MDAxxx series, full support for LV series, AT88SCxxx • Serial Flash: standard SPI (25Pxxx, 25Fxxx, 25Lxxx, 25Bxxx, 25Txxx, 25Sxxx, 25Vxxx, 25Uxxx, 25Wxxx, 45PExx), high performance Dual I/O SPI (25Dxxx, 25PXxxx), high performance Quad SPI (25Dxxx, 26Vxxx), DataFlash (AT45Dxxx, AT26Dxxx) • Configuration (EE)PROM: XCFxxx, XC17xxxx, Data taal (4150xxx, 7120xxx, 7117xxx, 71187xxx, 7117xx) XC18Vxxx, PCXxx, PCSxxx, AT175xxx, 71187xxx, 71207xx DS1xxx, DS2xxx • PROM: AMD, Harris, National, Philips/Signetics, Tesla, TI • NV RAM: Dallas DSxxx, SGS/Inmos MKxxx, SIMTEK STKxxx, XICOR-2xxx, ZMD U63x series • FRAM: Ramtron • MRAM: Everspin MRxxxxx8x • PLD Altera: MAX 3000A, MAX 7000A, MAX 7000B, MAX 7000S, MAX7000AE, MAX II/G/Z • PLD Lattice: ispGAL22V10x, ispLSI1xxx, ispLSI1xxxEA, ispLSI2xxx, ispLSI2xxxA Laute: spudleze tox, spicol nox, spicol noxel, noxe CoolRunner-II • other PLD: SPLD/CPLD series: AMI, Atmel, AMD-Vantis, Gould, Cypress, ICT, Lattice, NS, Philips, STM, VLSI, TI • FPGA: Actel: ProASIC3, GLOO, Fusion • FPGA: Lattice: MachXO, LatticeXP, IspXPGA • FPGA: Xilinx: Spartan-3AN • NAND FLASH: Samsung K9xxx, Hynix HY27xxx, Toshiba TC58xxx, Micron MT29Fxxx, Spansion S30Mxxx, Numonyx (ex STM) NANDxxx • LBA-NAND: Toshiba THGVNxxx • mDOC H3: SanDisk (ex M-Systems) SDED5xxx, SDED7xxx, MD2533xxx, MD2534xxx, Hynix HY23xxx • Multi-chip devices: NAND+RAM, NOR+RAM, NOR+NOR+RAM, NAND+NOR+RAM - Clocks: TI(TMS), Cypress • Special chips: Atmel Tire Pressure Monitoring ATA6285N, ATA6286N, PWM controllers: Zilker Labs, Analog Devices, Gamma buffers: TI, Maxim ... • MCU 48 series: 87x41, 87x42, 87x48, 87x49, 87x50 series • MCU 51 series: 87xx, 87Cxxx, 87LVxx, 89Cxxx, 89Sxxx, 89Fxxx, 89LVxxx, 89LSxxx, 89LPxxx, 89Exxx, 89Lxxx, all manufacturers, Philips LPC series • MCU Intel 196 series: 87C196 KB/KC/KD/KT/KR/... • MCU Atmel ARM. ARM7: AT91SAM7Sxx, AT91SAM7Lxx, AT91SAM7Xxx, AT91SAM7XCxx, AT91SAM7SExx series; ARM9: AT91SAM9xxx series; ARM Cortex-M3: AT91SAM3Uxxx series • MCU Atmel AVR 8bit/16bit: AT90Sxxxx, AT90pwm, AT90can, AT90usb, ATtiny, ATmega, ATxmega series • MCU Atmel AVR32: AT32UC3xxxx • MCU Chipcon (TI): CC11xx, CC24xx, CC25xx series - MCU Coreriver: Atom 1.0, MiDAS1.0, 1.1, 2.0, 2.1, 2.2, 3.0 series • MCU Cypress: CY7Cxxxxx, CY8Cxxxxx • MCU ELAN: EM78Pxxx MCU Infineon(Siemens): XC800, C500, XC166, C166 series • MCU MDT 1xxx McD millipoli(sieninity): ACedu, Cabu, Xc red, Creb series - McD MD Fix, and 2xxx series - MCU Microchip PICmicro: PIC10xxx, PIC12xxxx, PIC16xxx, PIC17Cxxx, PIC18xxx, PIC24xxx, dsPIC, PIC32xxx series - MCU Motorola/Freescale: HC05, HC08, HC11, HC12, HCS08, RS08, S12, S12X, MC56F, MCF51, MCF52 series - MCU Myson MTV2xx, 3xx, 4xx, 5xx, CS89xx series • MCU National: COP8xxx series • MCU NEC: uPD70Fxxx, uPD78Fxxx series • MCU Novatek: NT68xxx series • MCU Nuvoton (Winbord): N79xxx, W77xxx, W78xxx, W79xxx, W83xxx series • MCU NXP ARM Cortex-M3 LPC13xx, LPC17xx series • MCU Philips (NXP) UOC series: UOCIII, UOC-TOP, UOC-Fighter series • MCU Philips (NXP) ARM7: LPC2xxx, PCD807xx, SAF7780xxx series • MCU Scenix (Ubicom): SXxxx series • MCU Renesas: R8C/Tiny series • MCU SGS-Thomson: ST6xx, ST7xx, ST10xx, STR7xx series MCU SyncMOS: SM59xxx, SM73xxx, SM79xxx, SM89xxx series • MCU & Programmable System Memory STMicroelectronics: uPSD, PSD series • MCU STM: ST6xx, ST7xx, ST10xx, STR7xx, STR9xx, STM32Fxx, STM8A/S/L series MCU Silicon Laboratories(Cygnal): C8051 series • MCU Texas Instruments: MSP430, MSC12xx series, TMS320F series • MCU Texas Instruments (ex Luminary Micro): LM3Sxxx, LM3Sxxxx series • MCU ZILOG: Z86/Z89xxx and Z8Fxxxx, ZGP323xxxxxx, ZLF645xxxxx, ZGP323xxxxxx, ZLF645xxxxx, ZGP323xxxxxx, ZLF645xxxxx, ZGP323xxxxxx, ZLF645xxxxx, ZLF645xxxx, ZGP323xxxxxx, ZLF645xxxx, ZLF645xxx, ZLF645xx, ZLF6xx, ZL Samsung, Toshiba, Mitsubishi, Realtek, M-Square, ASP, Coreriver, Gencore, EXDDUS Microelectronic, Megawin, Syntek, Topro, TinyARM, VersaChips, SunplusIT, Nordic, M-Square, QIXIN, Signetic, Tekmos, Weltrend, Amic, Cyrod Technologies, Ember, Ramtron, Nordic Semiconductor, Samsung Programmer, through ISP connector

 Serial E(E)PROM: IIC series, MW series, SPI series, KEELOQ series, PLD configuration memories, UNI/O series • 1-Wire E(E)PROM: DS1xxx, Ds2xxx • Serial Flash: standard SPI (25xxx), DataFlash (AT45Dxxx, AT26Dxxx) • MCU Atmel: AT89Sxxx, AT90pwm, AT90can, AT90usb, AT90Sxxxx, ATtiny, ATmega, ATxmega, AT89LSxxx, AT89LPxxx • MCU Atmel AVR32: AT32UC3xxxx • MCU Chipcon (TI): CC11xx, CC24xx, CC25xx series • MCU Cypress: CY8C2xxxx • MCU Elan: EM78Pxxx, EM6xxx series • MCU EM Microelectronic: 4 and 8 bit series • MCU Microchip PICmicro: PIC10xxx, PIC12xxx, PIC16xxx, PIC17xxx, PIC18xxx, PIC24xxx, dsPIC, PIC32xxx series • MCU Mitsubishi: M16C • MCU Motorola/Freescale: HC08 (both 5-wire, All-wire), HC11, HC12, HCS08, S12,

S12X, MC56F, MCF52 series • MCU Nordic Semiconductor: nRF24xxx • MCU NEC: uPD7xxx series • MCU Phillips (NXP): LPC1xxx, LPC2xxx, LPCxx series, 89xxx series • MCU Renesas: R8C/Tiny series • MCU Realtek, M-Square • MCU Social Sentis Control MCU TI: MSP430 (both JTAG and BSL series), MSC12xxx series • MCU ZILOG: Z8Fxxxx, Z8FMCxxxxx, Z16Fxxxx series, ZLF645x0xx • Various PLD (also by Zoroxox, ZoriviCxxxxx, Zirorxxxx serilis, Ziroqoxxx, Various PLD (also U) Jam/VME/SVF/STAPL/... Player/JTAG support):Altera: MAX 3000A, MAX 7000A, MAX 7000B, MAX 7000S, MAX 9000, MAX II/G/Z Xilinx: XQ9500, XQ9500XL, XC9500XV, CoolRunner XPLA3, CoolRunner-II • PLD Lattice: ispGAL22xV10x, ispLSI1xxxEA, ispLSI2xxxV, ispLSI2xxxVL, ispLSI2xxxVL, M4-xx/xx, M4LV-xx/xx, M4A3-xx/xx, M4A5-xx/xx, LC4xxxB/C/V/ZC/ZE, ispCLOCK, Power Manager/II, ProcessorPM • FPGA: Actel: ProASIC3, IGLOO, Fusion · FPGA: Lattice: MachXO, LatticeXP, ispXPGA

Notes: - devices marked \* are obsolete, programming with additional module - for all supported devices see actual DEVICE LIST at www.elnec.com

#### I.C. Tester

- TTL type: 54,74 S/LS/ALS/H/HC/HCT series
   CMOS type: 4000, 4500 series Static RAM: 6116 ... 624000
   User definable test pattern generation

#### Package support

- support all devices in DIP with default socket
- support all devices in Dir with delauft sucket package support includes DIP, SDIP, PLCC, JLCC, SOIC, SOP, PSOP, SSOP, TSOP, TSOPII, TSSOP, GFP, POFP, TOFP, VOFP, QFN (MLF), SON, BGA, EBGA, FBGA, VFBGA, UBGA, FTBGA, LAP, CSP, SCSP etc.
- support devices in non-DIP packages up to 48 pins with universal adapters
   programmer is compatible with third-party adapters for non-DIP support

#### SOFTWARE

- Algorithms: only manufacturer approved or certified algorithms are used. stom algorithms are available at additional cost.
- Algorithm updates: software updates are available approx. every 2 weeks, free of charge. OnDemand version of software is available for highly needed chips support and/or bugs fixes. Available nearly daily.
   Main features: revision history, session logging, on-line help, device and algorithm inferentias.
- algorithm information.

#### **Device operations**

standard: intelligent device selection by device type, manufacturer or typed fragment of part name • automatic ID-based selection of EPROM/Flash EPROM • blank check, read, verify • program • erase • configuration and security bit program • illegal bit test • checksum • interprete the Jam Standard Test and

Programming Language (STAPL), JEDEC standard JESD-71 • interprete the VME files compressed binary variation of SVF files • interprete the SVF files (Serial Vector Format) . interprete the Actel STAPL Player files

- security · insertion test, reverse insertion check · contact check · ID byte check special
- · production mode (automatic start immediately after device insertion)
- multi-project mode lot of serialization modes (more type of incremental modes, from-file mode, custom generator mode) statistic • count-down mode

#### **Buffer operations**

· view/edit, find/replace · fill/copy, move, byte swap, word/dword split checksum (byte, word) . print

## File load/save

no download time because programmer is PC controlled automatic file type identification

#### Supported file formats

- unformatted (raw) binary
   HEX: Intel, Intel EXT, Motorola S-record, MOS, Exormax, Tektronix, ASCII-SPACE-HEX,, ASCII HEX
- Altera POF, JEDEC (ver. 3.0.A), eg. from ABEL, CUPL, PALASM, TANGO PLD, OrCAD PLD, PLD Designer ISDATA, etc.
- · JAM (JEDEC STAPL Format), JBC (Jam STAPL Byte Code), STAPL (STAPL File) JEDEC standard JESD-71
- VME (ispVME file VME2.0/VME3.0)
- · SVF (Serial Vector Format revision E) · STP (Actel STAPL file)

## GENERAL

## Recommended PC system requirements

- Microsoft Windows® XP
   PC Pentium 4, 2 GHz
- 512 MB of RAM 150 MB of free disk space CDROM drive
- either one USB port, 2.0 compatible or
- one (parallel) printer port with nothing attached, the IEEE 1284 compatible printer port (ECP/EPP) on PCI bus recommended

#### Operation

- · operating voltage: 110-240VAC 50/60Hz
- power consumption: max. 20W active, about 2W sleep
   dimensions: 195x140x55 mm (7.7x5.5x2,2 inch) weight: 0.9kg (1.98 lb)
- temperature: 5'C ÷ 40'C (41'F ÷ 104'F)
- humidity: 20%...80%, non condensing

#### REGISTER YOUR PROGRAMMER AND TAKE ADVANTAGES

Dear customer,

thank you for purchasing Elnec device programmer.

Please register your new programmer on-line at our web site www.elnec.com (section support) within 60 days from the date of purchase.

Advantages of users, who register his programmer:

- the registration of product ensures preferential handling of your requests against requests from non-registered users
- only registered customers can place AlgOR request (request for implementation of new chip support)

REMOVE THIS LABEL AFTER REGISTRATION

## How to use this manual

This manual explains how to install the control program and how to use your programmer. It is assumed that the user has some experience with PCs and installation of software. Once you have installed the control program we recommend you consult the context sensitive HELP within the control program rather than the printed User's Manual. Revisions are implemented in the context sensitive help before the printed User's Manual.

## Dear customer,

thank you for purchasing one of the **ELNEC** programmer.

Please, download actual version of manual from ELNEC WEB site (www.elnec.com), if current one will be out of date.

Warranty terms	

## Conventions used in the manual

References to the control program functions are in bold, e.g. **Load**, **File**, **Device**, etc. References to control keys are written in brackets <>, e.g. <**F1>.** 

## Terminology used in the manual:

Device ZIF socket PMI	any kind of programmable integrated circuits or programmable devices Zero Insertion Force socket used for insertion of target device Programmer Module Interface - connectors used for insertion programming module to programmer
Buffer	part of memory or disk, used for temporary data storage
Printer port	type of PC port (parallel), which is primarily dedicated for printer connection.
USB port	type of PC port (serial), which is dedicated for connecting portable and peripheral devices.
HEX data format	format of data file, which may be read with standard text viewers; e.g. byte 5AH is stored as characters '5' and 'A', which mean bytes 35H and 41H. One line of this HEX file (one record) contains start address and data bytes. All records are secured with checksum.

# Introduction

#### This user's manual covers these ELNEC programmers: BeeHive204AP and BeeProg2AP.

**BeeHive204AP** is the core for automated programmers and automatic test equipments (ATE). It is extremely fast universal 4x 48-pindrive **concurrent multiprogramming system** designed for high volume production programming. **BeeHive204AP** is an industrial version of **BeeHive204**. The chips are programmed at near theoretical maximum programming speed. Using build-in ISP connectors the programmer is able to program ISP capable chips in-circuit.

**BeeProg2AP** is the core for automated programmers and automatic test equipments (ATE) too. It is a extremely fast universal programmer with 48 powerful pindrivers designed for low volume production programming. **BeeProg2AP** is an industrial version of **BeeProg2**. Using build-in ISP connector the programmer is able to program ISP capable chips in-circuit.

Advanced design, including protection circuits, original brand components and careful manufacturing allows us to provide a **three-years warranty** for BeeHive204AP and BeeProg2AP on parts and labor for the programmers (limited to 500 insertion of programming module to Programming Module Interface connectors). This warranty terms are valid for customers, who purchase a programmer directly from Elnec company. The warranty conditions of Elnec sellers may differ depending on the target country law system or Elnec seller's warranty policy.

	programmer	USB cable	external power supply	AP1 PMI selftest pod	AP1 ISP connector selftest pod	AP1 calibration test pod	ISP cable	software	User's manual	registration card	shipping case
BeeHive204AP	•	•	•	1x	1x	1x	4x	•	•	•	•
BeeProg2AP	•	•	•	٠	•	-	•	•	•	•	•

## **Products configuration**

Before installing and using your programmer, please carefully check that your package includes all next mentioned parts. If you find any discrepancy with respective parts list and/or if any of these items are damaged, please contact your distributor immediately.

## PC requirements

## Minimal PC requirements

	OS - Windows	CPU	RAM [MB]	free disk space [MB]	USB 2.0 high speed	USB 1.1	CDROM
2x BeeHive204AP	XP	C2D 2,6GHz	1000	400	•	-	٠
BeeHive204AP	2000	P4	512	200	•	-	•
BeeProg2AP	2000	P4	256	200	-	٠	٠

## **Recommended PC requirements**

	swopuja - SO	CPU	RAM [MB]	free disk space [MB]	USB 2.0 high speed	CDROM
2x BeeHive204AP	XP – 7	C2Quad	2000	2000	٠	•
BeeHive204AP	XP – 7	C2D	1000	1000	•	•
BeeProg2AP	XP – 7	C2D	1000	1000	•	•

These PC requirements are valid for 2.77/03.2011 version of control program for programmers. For other version see www.elnec.com.

Free disk space requirement depends also on used IC device size and number of attached programming sites. For large devices the required free space on disk will be approximately 1000MB + 2x Device size x number of programming sites attached to this PC.

Very easy indication, if your PC in hardware/software configuration is good enough for the current software version and current situation with Pg4uw/Pg4uwMC, is to run Windows task manager (Ctrl+Alt+Del) and see the performance folder. It have to be max. 80% of CPU usage at full run of programming system.

## Free additional services:

# Why is it important to use the latest version of the control program?

• Semiconductor manufacturers continuously introduce new devices with new package types, manufactured by new technologies in order to support the need for flexibility, quality and

speed in product design and manufacturing. To keep pace and to keep you up-to-date, we usually implement more than 7000 new devices into the control program within a year.

- Furthermore, a typical programmable device undergoes several changes during its lifetime in an effort to maintain or to improve its technical characteristics and process yields. These changes often impact with the programming algorithms, which need to be upgraded (the programming algorithm is a set of instructions that tells the programmer how to program data into a particular target device). Using the newest algorithms in the programming process is the key to obtaining high quality results. In many cases, while the older algorithm will still program the device, they may not provide the level of data retention that would be possible with an optimal algorithm. Failure to not use the most current algorithm can decrease your programming yields (more improper programmed target devices), and may often increase programming times, or even affect the long term reliability of the programmed device.
- We are making mistakes too ...

Our commitment is to implement support for these new or modified parts before or as soon as possible after their release, so that you can be sure that you are using latest and/or optimal programming algorithms that were created for this new device.

- free technical support (phone/fax/e-mail).
- free lifetime software update via Web site.

Free software updates are available from our Internet address www.elnec.com.

We also offer the following new services in our customer support program: Keep-Current and AlgOR.

- Keep-Current is a service by which ELNEC ships to you the latest version of the control program for programmer and the updated user documentation. A Keep-Current service is your hassle-free guarantee that you always have access to the latest software and documentation, at minimal cost. For more information see <u>www.elnec.com</u>.
- AlgOR (Algorithm On Request) service allows you to receive from ELNEC software support for programming devices not yet available in the current device list. For more information see <a href="http://www.elnec.com">www.elnec.com</a>.

# BeeHive204AP

## Introduction

**BeeHive204AP** is the core for automated programmers and automatic test equipments (ATE). It is extremely fast universal 4x 48-pindrive **concurrent multiprogramming system** designed for high volume production programming.

**BeeHive204AP** consist from four **BeeProg2** based independent programming modules. The chips are programmed at near theoretical maximum programming speed.

**BeeHive204AP** is an industrial version of **BeeHive204** programmer for usage in automated programmers. The differences are:

- the dimensions of the **BeeHive204AP** programmer are reduced compared to the BeeHive204 in intent to minimize overhead of the handler's arm movement
- more mechanically stable case to be immune against vibration during operation. The case of BeeHive204AP is prepared to be fastened from top or from bottom of programmer body into automated programmer working place
- different construction of programming modules, stable enough for insert/replace chips by mechanical arm and also that allow to keep identical position of ZIF socket also after replacing of the module

Two **BeeHive204AP** units can be attached to one control PC to better utilize programming workplace. Elnec offer **Windows XP Embedded** driven **BeeHive204AP control unit**, which is able serve two **BeeHive204AP** programmers.

**BeeHive204AP** can be implemented into automated programmer (as a replacement of obsolete programmer) or into some handler by two ways:

1.using of standard PC, for example BeeHive204AP can be connected to the control PC of automated programmer (up to 2 BeeHive204AP can be attached to one computer using USB hub or USB ports of the PC).

2.using BeeHive204AP control unit (option)

- Up to 2 BeeHive204AP programmers are controlled by BeeHive204AP control unit. The BeeHive204AP control unit is Windows XP Embedded driven computer, optimized for industrial environment.
- One BeeHive204AP control unit in the system serve as a master unit. Here is running also multiprogramming control software, serialization engine and interface to the host system.
- Interfacing of BeeHive204AP control units is done over standard LAN and external LAN switch. Interfacing of BeeHive204AP master control unit and host systems is over LAN or RS232 (other interface on request).

Implementation of **BeeHive204AP** into available 3rd party automated programmers and handlers is using simple remote control of the **Pg4uwMC** control software. There exist examples of implementation for standard programming languages and of course we are ready to help customer with this task.

**Note:** For other (standard) parameters of BeeHive204AP programmer, see description of BeeHive204 please.

**BeeHive204AP** programming modules have schematics identical like modules for BeeHive204 programmer, but these modules are mechanically designed for perfect stability

at the top of the programmer and also in intent to keep identical position if the programming module is exchanged. There are available programming module for device in PLCC, SOIC, PSOP, TSOP, TSOP, TQFP, QFN (MLF), BGA and other packages.

**Note:** The programming modules have reference pin (corner) points to Left-Up corner of programming module. We accept also orders for other orientation of ZIF socket at programming module if needed, discuss please situation with our sales department.

**BeeHive204AP** programmer is driven by comfortable and easy to use control program, which work with all versions of MS Windows from Windows XP to Windows 7 64-bit

It is important to remember that in most cases new devices require **only a software update** due to the BeeHive204AP is truly universal programmer. With our unique quick reaction to customer's needs - software update can be ready within a day from request by OnDemand software

Advanced design including protection circuits, original brand components and careful manufacturing and burning allows us to provide a **three-year warranty** on parts and labor for the BeeHive204AP (limited to 500 insertion of programming module to Programming Module Interface connectors).

## BeeHive204AP elements

- 1) Programmer Module Interface (PMI) connectors
- 2) work result LEDs
- 3) power/sleep LED of site
- 4) ISP connector
- 5) Ø 4,5mm holes for fastening BeeHive204AP to bottom plate
- 6) M4 nuts for fastening BeeHive204AP to upper plate
- 7) programming module fixating screws
- 8) right site power supply connector
- 9) right site type B USB connector for PC ↔ BeeHive204AP communication cable
- 10) right site tie mount for fixating USB cable

Right top view to BeeHive204AP

- 11) rear site power supply connector
- 12) rear site type B USB connector for PC ↔ BeeHive204AP communication cable
- 13) rear site tie mount for fixating USB cable
- 14) temperature controlled fans
- 15) "GND" screw can be used for grounding of the programmer

Rear view to BeeHive204AP

## Selftest and calibration check

If you feel that your programmer does not react according to your expectation, please run the programmer (ISP connector) selftest using AP1 PMI selftest pod (AP1 ISP connector selftest pod), enclosed with the standard delivery package.

## Selftest of programmer

- Insert AP1 PMI selftest pod into Programmer Module Interface (PMI) connectors of the programmer.
- Run selftest of programmer in Pg4uw (Programmer / Selftest plus).

AP1 PMI selftest pod

## Selftest of ISP connector

- Insert **AP1 ISP connector selftest pod** into Programmer Module Interface (PMI) connectors of the programmer.
- Interconnect 20 pins connector of **AP1 ISP connector selftest pod** with an ISP connector of the programmer with an ISP cable, included in delivery programmer package. Be sure that pins are interconnected properly (i.e. 1-1, 2-2... 20-20).
- Run selftest of ISP connector in Pg4uw (Programmer / Selftest ISP connector...).

AP1 ISP connector selftest pod

## Calibration test

- Insert AP1 calibration test pod into Programmer Module Interface (PMI) connectors of the programmer.
- Run calibration test of programmer in Pg4uw (Programmer / Calibration test).

AP1 calibration test pod

## **Technical specification**

## GENERAL

- $\bullet$  external power supply unit: operating voltage 100-240V AC rated, 90-264 VAC max., 47-63  $\rm Hz$
- power consumption max. 60W active
- dimensions 310x205x61 mm (12.2x8.1x2.4 inch)
- weight (programmer) 3.5kg (7.7 lb)
- operating temperature 5°C ÷ 40°C (41°F ÷ 104°F)
- operating humidity 20%..80%, non condensing

# BeeProg2AP

## Introduction

**BeeProg2AP** is the core for automated programmers and automatic test equipments (ATE). It is a extremely fast universal programmer with 48 powerful pindrivers designed for low volume production programming. Using build-in ISP connector the programmer is able to program ISP capable chips in-circuit.

**BeeProg2AP** is an industrial version of **BeeProg2** programmer for usage in automated programmers. The differences are:

- the dimensions of the **BeeProg2AP** programmer are reduced compared to the BeeProg2 It is important mainly for implementation into ATE machines
- more mechanically stable case to be immune against vibration during operation. The case
  of BeeProg2AP is prepared to be fastened from top or from bottom of programmer body
  into automated programmer working place. For ISP programming only the case of
  BeeProg2AP can be fastened from left side too.
- different construction of programming modules, stable enough for insert/replace chips by mechanical arm and also that allow to keep identical position of ZIF socket also after replacing of the module

**BeeProg2AP** can be implemented into automated programmer or ATE machine as ISP programmer identically as **BeeProg2** programmer - using of standard PC. **BeeProg2AP** can be connected to the control PC of automated programmer too. Up to 8 BeeProg2AP can be attached to one computer using USB hub or USB ports of the PC

Implementation of **BeeProg2AP** into available 3rd party automated programmers and handlers is using simple remote control of the **Pg4uwMC** control software. There exist examples of implementation for standard programming languages and of course we are ready to help customer with this task.

**Note:** For other (standard) parameters of BeeProg2AP programmer, see description of BeeProg2 please.

**BeeProg2AP** programming modules have schematics identical like modules for BeeProg2 programmer, but these modules are mechanically designed for perfect stability at the top of the programmer and also in intent to keep identical position if the programming module is exchanged. There are available programming module for device in PLCC, SOIC, PSOP, SSOP, TSOP, TSOP, TSOP, TQFP, QFN (MLF), BGA and other packages.

**Note:** The programming modules have reference pin (corner) points to Left-Up corner of programming module. We accept also orders for other orientation of ZIF socket at programming module if needed, discuss please situation with our sales department.

**BeeProg2AP** programmer is driven by comfortable and easy to use control program, which work with all versions of MS Windows from Windows XP to Windows 7 64-bit

It is important to remember that in most cases new devices require **only a software update** due to the BeeProg2AP is truly universal programmer. With our unique quick reaction to customer's needs - software update can be ready within a day from request by OnDemand software

Advanced design including protection circuits, original brand components and careful manufacturing and burning allows us to provide a **three-year warranty** on parts and labor for the BeeProg2AP (limited to 500 insertion of programming module to Programming Module Interface connectors).

## BeeProg2AP elements

- 1) Programmer Module Interface (PMI) connectors
- 2) work result LEDs
- 3) power/sleep LED of site
- 4) ISP connector
- 5) M4 nuts for fastening BeeHive204AP to upper plate
- 6) programming module fixating screws

Right top view to BeeProg2AP

- 7) power supply connector
- 8) type B USB connector for PC ↔ BeeHive204AP communication cable
- 9) tie mount for fixating USB cable
- 10) temperature controlled fan
- 11) "GND" screw can be used for grounding of the programmer

Rear view to BeeHive204AP

## Selftest and calibration check

If you feel that your programmer does not react according to your expectation, please run the programmer (ISP connector) selftest using AP1 PMI selftest pod (AP1 ISP connector selftest pod), enclosed with the standard delivery package.

## Selftest of programmer

- Insert AP1 PMI selftest pod into Programmer Module Interface (PMI) connectors of the programmer.
- Run selftest of programmer in Pg4uw (Programmer / Selftest plus).

AP1 PMI selftest pod

## Selftest of ISP connector

- Insert **AP1 ISP connector selftest pod** into Programmer Module Interface (PMI) connectors of the programmer.
- Interconnect 20 pins connector of **AP1 ISP connector selftest pod** with an ISP connector of the programmer with an ISP cable, included in delivery programmer package. Be sure that pins are interconnected properly (i.e. 1-1, 2-2... 20-20).
- Run selftest of ISP connector in Pg4uw (Programmer / Selftest ISP connector...).

AP1 ISP connector selftest pod

## Calibration test

- Insert **AP1 calibration test pod** into Programmer Module Interface (PMI) connectors of the programmer.
- Run calibration test of programmer in Pg4uw (Programmer / Calibration test).

AP1 calibration test pod

## Multiprogramming by BeeProg2AP

During installation of Pg4uw at Select Additional Tasks window you check, if is allowed install BeeProg2AP multiprogramming control support.

For start of BeeProg2AP multiprogramming is necessary run special control program **Pg4uwMC.exe**. At this program user assign BeeProg2AP to control programs, may load projects for all BeeProg2AP and run Pg4uw for every connected and assigned BeeProg2AP.

## Technical specification

## GENERAL

- $\bullet$  external power supply unit: operating voltage 100-240V AC rated, 90-264 VAC max., 47-63 Hz
- power consumption max. 20W active, about 2W sleep
- dimensions 84x205x61 mm (3.3x8.1x2.4 inch)
- weight 0.7kg (1.5 lb)
- operating temperature 5°C ÷ 40°C (41°F ÷ 104°F)
- operating humidity 20%..80%, non condensing

# Setup

The programmer package contains a CD with the control program, useful utilities and additional information. The permission to freely copy the content of the CD is granted in order to demonstrate how ELNEC programmers work.

For programmers connected through USB port, control program requires correctly installed USB driver

We recommended install software before connecting programmer to PC to avoid unwanted complication during installation.

## Software setup

Insert delivered CD to your CD drive and install program starts automatically (if not, run setup.exe). Install program will guide you through the installation process and will do all the necessary steps before you can first run the control program.

Click on "Install software for programmers" button.

Welcom	e to Elnec programmers software Setup	×
12	Please select the language that you would like to use during the installation of Elnec programmers software	
	English 💌	
	OK Cancel	

Select language and than click on "OK" button.

Step 3.

Click on "Next" button

Setup - Elnec PG4UW/PG4UWMC	
Installation mode Default or Custom Select installation mode with default settings (Default) or customizable (Custom)	<b>R</b>
Please select an installation mode with default or custom settings (such as Progra Destination Location, Start Menu Folder, Additional tasks) by selecting Default or Custom option and pressing Next button	m

#### Step 8.

Setup - Elnec PG4UW/PG4UWMC	
Ready to Install Setup is now ready to begin installing Elnec PG4UW/PG4UWMC software, version 2.77b/03.2011, on your computer.	<b>R</b>
Click Install to continue with the installation, or click Back if you want to review or change any settings.	
Destination location: D:\workprog\ELNEC\programmer	^
Start Menu folder: Elnec	
Additional tasks:	=
Install Multiprogramming control support for following programmers: - BeeHive2085, BeeHive85 - BeeHive204, BeeHive204AP, BeeHive4+, BeeHive4 - BeeProg2, BeeProg2AP, BeeProg+, BeeProg	
< Back Install C	Cancel

Check your setting and then click on "Install" button

Installation process will start.

Click "Finish" button to finish setup.

#### Step 11. For Windows Vista only:

💼 Program Compatibility Assistant
This program might not have installed correctly
If this program didn't install correctly, try reinstalling using settings that are compatible with this version of Windows.
Program: Elnec Pg4uw Setup
Publisher:
<ul> <li>Reinstall using recommended settings</li> <li>This program installed correctly</li> </ul>
Cancel
What settings are applied?

Click "This program installed correctly"

## New versions of programmer software

In order to exploit all the capabilities of programmer we recommend using the latest version of Pg4uw. You may download the latest version of programmer software (file Pg4uwARC.exe) from our Internet site <u>www.elnec.com</u>.

Copy Pg4uwARC.exe to a temporary directory, disconnect programmer from PC and then launch it. Setup will start with **Step 2** from previous chapter.

## Hardware setup

When the programmer is connected to USB port before control program was installed, Windows will detect new hardware and ask user to select driver installation method: automatically or manually. To detect programmer correctly, control program installation CD must be inserted to computer's CD-ROM drive and following steps have to be done:

#### Step 1.

Directly connect USB cable to type B USB port on programmer.

#### Step 2.

Directly connect USB cable to type A USB2.0 port on PC.

#### Step 3.

Connect connectors of power supply cable to appropriate connectors on programmer and wall plug.

#### Step 4.

Programmer turn on. At this time all 'work result' LEDs light up successive and then LEDs switch off.

## Step 5.

Windows will start with "Found new hardware wizard". For Windows XP, Service Pack 2 users only:

For all:

Found New Hardware Wizard		
Please wait while the wizard searches		
	BeeProg2AP, Universal 48-pindrive Programmer	
	3	
	< Back	Next > Cancel

Wizard start searching programmer and start install driver automatically.

After successfully installing of programmer you will see following window: Found New Hardware Wizard

#### Step 8.

Click "Finish" button to finish setup.

"Found new hardware wizard" will launch for each programmer (programmer site) one time (for BeeHive204AP 4 times). Hardware setup will be continued with Step 5.

**Note:** If a different USB port on the PC is used for the next connection of programmer, "Found new hardware wizard" will launch again and install new USB drivers.

## Installation to target system

This chapter contains mechanical drawing of BeeHive204AP and BeeProg2AP and other information needed for installation BeeHive204AP and BeeProg2AP to target system.

## BeeHive204AP

On picture bellow are overall dimensions of BeeHive204AP with programming modules. Total height of programmer with installed programming modules depends of programming module ZIF socket height. Total height can be determined by **68,5mm + ZIF socket height**.

Right top view to BeeHive204AP with dimensions

At X axis a center of ZIF is same with center of programming module, but at Y axis not. For a lot of ZIFs, they center will be at the same position as on picture, but for some extra big ZIFs center of ZIF will be moved at Y axis.

If USB connector and power cable are connected to rear connectors, total depth of programmer will be **205mm + length of B type USB connector on USB cable**. Total depth of programmer may be **205mm + 50mm**.

If USB connector and power cable are connected to right side connectors, total width of programmer will be **310mm + length of B type USB connector on USB cable**. Total depth of programmer may be **310mm + 50mm**.

Mounting USB cable to case and length of USB connector with cable bending.

For proper connection DC adapter to programmer, arrow on cable connector must be oriented to arrow on programmer connector.

Arrows on power supply connectors

This connector has locking mechanism, to avoid unwanted disconnection. For disconnecting is needed pull locking collar on cable connector.

**BeeHive204AP** can be mounted on base plate by 6 screws M4 with nuts. Length of screw depend on base plate thickness. On base plate can be  $\emptyset$  4,5mm holes replaced with M4 internal threads.

Drawing for mounting programmer on base plate:

**BeeHive204AP** can be mounted bellow base plate by 6 screws M4. Length of screw depend on base plate thickness.

Attention: For proper mounting of programmer bellow base plate, mounting screws must be minimal 3mm depth in programmer. To avoid damage of PCB in programmer mounting screws must be maximum 8mm depth in programmer. Drawing for mounting programmer bellow base plate:

### BeeProg2AP

On picture bellow are overall dimensions of BeeProg2AP with programming module. Total height of programmer with installed programming modules depends of programming module ZIF socket height. Total height can be determined by **68,5mm + ZIF socket height**.

Right top view to BeeProg2AP with dimensions

At X axis a center of ZIF is same with center of programming module, but at Y axis not. For a lot of ZIFs, they center will be at the same position as on picture, but for some extra big ZIFs center of ZIF will be moved at Y axis.

USB connector and power cable are connected to rear connectors, total depth of programmer will be **205mm + length of B type USB connector on USB cable**. Total depth of programmer may be **205mm + 50mm**.

Mounting USB cable to case and length of USB connector with cable bending.

For proper connection DC adapter to programmer, arrow on cable connector must be oriented to arrow on programmer connector.

Arrows on power supply connectors

This connector has locking mechanism, to avoid unwanted disconnection. For disconnecting is needed pull locking collar on cable connector.

**BeeProg2AP** can be mounted on base plate by 2 screws M3. Length of screw depend on base plate thickness.

Attention: For proper mounting of programmer on base plate, mounting screws must be minimal 3mm depth in programmer. To avoid damage of PCB in programmer mounting screws must be maximum 8mm depth in programmer. Drawing for mounting programmer on base plate:

#### Assembly holes in base plane, when programmer is on base plate

**BeeProg2AP** can be mounted bellow base plate by 4 screw M4. Length of screw depend on base plate thickness.

**Attention:** For proper mounting of programmer on base plate, mounting screws must be minimal 3mm depth in programmer. To avoid damage of PCB in programmer mounting screws must be maximum 8mm depth in programmer. Drawing for mounting programmer bellow base plate:

#### Assembly holes in base plane, when programmer is bellow base plate

**BeeProg2AP** can be mounted with left side on base plate by 4 screws M3. Length of screw depend on base plate thickness.

Attention: Before mounting BeeProg2AP in this way, unscrew two screws M3 located on left side. Then replace them with new M3 screws with proper length. For proper mounting of programmer on base plate, mounting screws must be minimal 3mm depth in programmer. To avoid damage of PCB in programmer mounting screws must be maximum 8mm depth in programmer.

Drawing for mounting programmer with left side on base plate:

# Pg4uw

# Pg4uw-the programmer software

Program Pg4uw.exe is common control program for all ELNEC programmers. We guarantee running of these programs under all of above mentioned operating systems without any problems. Also background operation under Windows is error-free.

## Using the programmer software

The control program delivered by ELNEC, included on the CD in your package, is granted to be free from any viruses at the moment of delivery. To increase their safety our programs include a special algorithm for detecting possible virus infections.

### Run the control program

In Windows environment: double click to icon Pg4uw.

After start, control program Pg4uw automatically scan all existing ports and search for the connected any ELNEC programmer. Program Pg4uw is common for all the ELNEC programmers, hence program try to find all supported programmers.

**Notes:** When Pg4uw is started, program is checked for its integrity. Than the program display a standard user menu and waits for your instructions.

If the control program cannot communicate with the programmer, an error message appears on the screen, including error code and description of possible reasons (disconnected programmer, bad connection, power supply failure, incompatible printer port...). Eliminate the error source and press any key. If error condition still exists, the program resumes its operation in the demo mode and access to the programmer is not possible. If you cannot find the cause of the error, follow the instructions in **Troubleshooting** section. In addition, the control program checks communication with programmer prior to any operation with the programmed device.

# Description of the user screen

#### Toolbars

Under main menu are placed toolbars with button shortcuts of frequently used menu commands. Toolbars are optional and can be turned off by menu command **Options / View**.

#### Log window

Log window contains the flow-control progress information about almost every operation made in Pg4uw.

Operation can be:

- starting of Pg4uw
- programmer search
- file/project load/save
- · selection of device

- device operations (device read, blank check, programming, ...)
- remote control application connection and disconnection

#### • and other

Content of Log window can be saved to file concurrently while information is written to Log window. This option can be set by menu **Options / General options** (and tab *Log file* in dialog *General options*).

### Panel Addresses

Panel Addresses contains information about actual address ranges of currently selected device, loaded file and buffer start-end address settings. Some devices allow modifying default device and buffer address ranges by menu command **Device / Device options / Operation options**.

Panel Addresses also contains some advanced information about current status of Split, Serialization and buffer checksum. For more information about each of the options, please look at:

- Split menu Device / Device options / Operation options
- Serialization menu Device / Device options / Serialization
- Checksum menu Buffer / Checksum at section Checksum displayed in main window

#### Panel Programmer

Panel Programmer contains information about currently selected programmer. The information includes

- programmer type
- port via programmer is connected to computer
- programmer status, can be one of following
  - Ready programmer is connected, successfully found and ready to work
  - Not found programmer is not found
  - Demo when user selects option (button) Demo in dialog Find programmer
- YES! mode some types of programmers allow to use special modes of starting next device operation in one of following ways -
  - manually by control program dialog Repeat
  - manually by button YES! placed directly on programmer
  - automatically programmer automatically detects device removing and insertion of new device

For more details please look at Programmer / Automatic YES!.

#### **Panel Device**

It contains information about currently selected device.

The information includes

- device name (type) and manufacturer
- device adapter needed to use with currently selected programmer
- reference to detailed Device info dialog, available also by menu Device / Device info
- reference to Advanced device options this is available for some types of devices only

#### **Panel Statistics**

It contains statistics information about currently selected device. The information includes

- number of successful, failure and total device operations
- · count-down status indicating number of remaining devices

Statistics and count-down options are available by menu command **Device / Device options** / **Statistics** or by mouse right click on panel *Statistics* and select item Statistics from popup menu

#### Panel File

The panel is placed on the bottom of Pg4uw main window. Panel shows currently loaded file or project name, size and date.

LIST OF NOT KEYS		
<f1></f1>	Help	Calls Help
<f2></f2>	Save	Save file
<f3></f3>	Load	Load a file into the buffer
<f4></f4>	Edit	Viewing/editing of buffer
<f5></f5>	Select/default	Target-device selection from 10 last selected devices list
<alt+f5></alt+f5>	Select/manual	Target-device selection by typing device/vendor name
<f6></f6>	Blank	Blank check
<f7></f7>	Read	Reads device's content into the buffer
<f8></f8>	Verify	Compares contents of the target device with the buffer
<f9></f9>	Program	Programs target device
<alt+q></alt+q>	Exit without save	Terminates the Pg4uw
<alt+x></alt+x>	Exit and save	Terminates the Pg4uw and saving settings too
<ctrl+f1></ctrl+f1>		Displays additional information about current device
<ctrl+f2></ctrl+f2>	Erase	Fill's the buffer with a given value
<ctrl+shift+f2></ctrl+shift+f2>		Fill's the buffer with random values.

# File

Menu File is used for source files manipulation, settings and viewing directory, changes drives, changes start and finish address of buffer for loading and saving files by binary, MOTOROLA, MOS Technology, Intel (extended) HEX, Tektronix, ASCII space, JEDEC, and POF format. The menu commands for loading and saving projects are located in this submenu too.

### File / Load

Analyse file format and loads the data from specified file to the buffer. You can choose the format desired (**binary**, **MOTOROLA**, **MOS Technology**, **Tektronix**, **Intel (extended) HEX**, **ASCII space**, **JEDEC** and **POF**). The control program stores a last valid mask for file listing. You can save the mask into the config. file by command **Options / Save options**.

The reserved key **<F3>** will bring out this menu from any menu and any time.

#### Note for special x16 formats:

Intel HEXx16 is Intel Hex file format with 16 bits data word for TMS320F devices. Motorola HEXx16 is Motorola file format with 16 bits data word for TMS320F devices.

Checking the check box **Automatic file format recognition** tells program to detect file format automatically. When program can't detect file format from one of supported formats, the binary file format is assumed.

When the check box Automatic file format recognition is unchecked program allows user to manually select wished file format from list of available file formats on panel Selected file

format. Default set is from Options / General options in panel Load file format at tab File options.

**Attention:** Program doesn't know recognize files in ASCII Hex format automatically, it recognizes them as binary. So download files in ASCII Hex format with disabled option for automatic file format recognition.

#### Panel Additional operation

Checking the check box **Erase buffer before loading** tells the program to erase all buffer data using entered Erase value. Buffer erase is performed immediately before reading file content to buffer and it is functional for binary and all HEX file formats. Using this one-shot setting disables current setting of **Erase buffer before loading** option in menu **Options** / **General options** at tab **Hex file options**.

If the checkbox **Swap bytes** is displayed, the user can activate function of swapping bytes within 16bit words (or 2-byte words) during reading of file. This feature is useful especially when loading files with Motorola representation of byte order in file (big endian). Standard load file is using little endian byte order.

**Note:** Big-endian and little-endian are terms that describe the order in which a sequence of bytes are stored in computer memory. Big-endian is an order in which the "big end" (most significant value in the sequence) is stored first (at the lowest storage address). Little-endian is an order in which the "little end" (least significant value in the sequence) is stored first. For example, in a big-endian computer, the two bytes required for the hexadecimal number 4F52 would be stored as 4F52H in storage address 1000H as: 4FH is stored at storage address 1000H, and 52H will be at address 1001H. In a little-endian system, it would be stored as 524FH (52H at address 1000H, and 4FH at address 1001H). Number 4F52H is stored in memory:

Address	Big endian system	Little endian system
1000H	4FH	52H
1001H	52H	4FH

#### Panel Buffer offset for loading

Panel **Buffer offset for loading** contains one-shot offset setting for loading data from file to buffer. The setting is used to specify optional offset of loaded data to store to buffer. When Load file dialog window is opened, offset has always default setting None. It means, no offset is used to store read data in buffer.

Available offset options are:

None this setting means, no offset is applied for loading data from file to buffer. Positive offset set of offset value, which is added to current address to store data to buffer. This offset is available for all formats and is used in x8 format, if current buffer organization is x8, or in x16 format, if current buffer organization is x16.

#### **Negative offset** mode has two options:

**Negative offset** and **Automatic negative offset** - set by two ways: manual or automatic. For manual set use option Negative offset and put wished offset value to its edit box.

For automatic offset detection use option Automatic negative offset. This value is subtracted from current address for save data to buffer.

Negative offset value (manually defined or automatically detected) is subtracted from current buffer address for store data to buffer.

Negative offset is applied only for all HEX file formats and is using always x8 format. Negative offset settings are ignored for binary files and other non-HEX files.

#### Notes:

- Since the value of negative offset is subtracted from real address, the result of subtraction can be negative number. Therefore take care of correct setting of this value!
- We recommend automatic set of negative offset in special cases only. This option contains a heuristic analyze, which can treat some data in file incorrectly. There are especially critical files, which contain a fragmented addresses range and which exceeds a size of selected device some block can be ignored.
- Automatic negative offset option is not available for some kinds of special devices, that require HEX files with exactly specified blocks used for the devices - for example Microchip PICmicro devices. For these special devices, there are available only manual offset settings (None, Positive offset, Negative offset).

#### Example for negative offset using:

A file contains data by Motorola S - format.

A data block started at address FFFF0H.

It is a S2 format with length of address array of 3 bytes.

For all data reading you can set Negative offset option and value of negative offset to FFFF0H.

It means, that the offset will be subtracted from current real addresses and so data will be written from buffer address 0.

#### List of file format codes and error codes

There can occur some errors during file download in some of supported formats. The error is written to LOG window in face "Warning: error #xxy in line rrr", xx is file format code, y is error code and rrr is line number in decimal.

File format codes: #00y - binary #10y - ASCII Space #20y - Tektronix #30y - Extended Tektronix #40y - Motorola #50y - MOS Technology #60y - Intel HEX

Load file error codes:

- #xx1 bad first character header
- #xx2 bad character in current line
- #xx3 bad CRC
- #xx4 bad read address
- #xx5 bad length of current line
- #xx6 too big negative offset

#xx7 - address is out of buffer range#xx8 - bad type of selected file format#xx9 - the file wasn't loaded all

# File / Save

Saves data in the buffer, which has been created, modified, or read from a device onto a specified disk. The file format of saved file can be chosen from supported formats list box. There can be also entered the Buffer start and Buffer end addresses which exactly specify part of buffer to save to file. Supported file formats now are **binary**, **MOTOROLA**, **MOS Technology**, **Tektronix**, **Intel (extended) HEX**, **ASCII space**, **JEDEC** and **POF**.

If the checkbox **Swap bytes** is displayed, the user can activate function of swapping bytes within 16bit words (or 2-byte words) during writing to file. This feature is useful especially when saving files with Motorola representation of byte order in file (big endian). Standard save file operation is using little endian byte order.

The reserved key <F2> will bring out this menu from any menu and any time.

# File / Load project

This option is used for loading project file, which contains device configuration buffer data saved and user interface configuration.

The standard dialog **Load project** contains additional window - **Project description** - placed at the bottom of dialog. This window is for displaying information about currently selected project file in dialog Load project.

Project information consists of:

- manufacturer and name of the first device selected in the project
- date and time of project creation
- user written description of project (it can be arbitrary text, usually author of project and some notes)

Note: for projects with serialization turned on

Serialization is read from project file by following procedure:

- 1. Serialization settings from project are accepted
- Additional serialization file search is performed. If the file is found it will be read and serialization settings from the additional file will be accepted. Additional serialization file is always associated to the specific project file. When additional serialization file settings are accepted, project serialization settings are ignored.

Name of additional serialization file is derived from project file name by adding extension ".sn" to project file's name.

Additional serialization file is always placed to the directory "serialization\" into the control program's directory.

Example:

Project file name: my\_work.prj Control program's directory: c:\Program Files\Programmer\

The additional serialization file will be:

c:\Program Files\Programmer\serialization\my\_work.prj.sn

Additional serialization file is created and refreshed after successful device program operation. The only requirement for creating additional serialization file is load project with serialization turned on.

Command **File / Save project** deletes additional serialization file, if the file exists, associated with currently saved project.

# File / Save project

This option is used for saving project file, which contains settings of device configuration and buffer data saved. Data saved to project file can be restored anytime by menu command **File** / **Load project**.

The dialog **Save project** contains three additional windows in **Project description** panel placed at the bottom of dialog **Save project**. The windows are for displaying information about currently selected project file in dialog **Save project** and information about current project, which has to be saved. Dialog **Save project** contains also additional checkboxes and button with picture of key displayed.

The first checkbox named "Set Protected mode of software after loading of this project file" and button with key are used to save project in special mode called Protected mode. Clicking on the button with key displayed, password dialog appears which is used to specify Protected mode password of recently saving project. Projects saved with active Protected mode checkbox and password are special projects also called Protected mode projects. For more detailed information about Protected mode projects see Options / Protected mode.

The second checkbox named "Require project file checksum before first programming" has special function. When the checkbox is checked, program Pg4uw will ask user for entering correct project checksum before allowing to start the first device programming. The checkbox has effect after loading of project file, which was saved with the checkbox checked. Usage of the checkbox is recommended for additional check, that correct project file is recently loaded. There is also recommended to use this checkbox along with active Protected mode (the first checkbox "Set Protected mode of software after loading of this project file" checked).

Project information consists of:

- manufacturer and name of the first device selected in the project
- date and time of project creation
- user written description of project (it can be arbitrary text, usually author of project and some notes)

The first (upper) window contains information about currently selected project file in dialog Save project.

The second (middle) windows displays information about actual program configuration including currently selected device, active programmer, date, time. These actual program settings are used for creation of project description header.

The third (bottom) window is user editable and contains project description (arbitrary text), which usually consists of project author and some notes.

# File / Reload file

Choose this option to reload a recently used file.

When you use a file, it is added to the **Reload file** list. Files are listed in order depending on time of use of them. Lastly used files are listed before files used far off.

To Reload a file:

1. From the File menu, choose Reload file.

2.List of lastly used files is displayed. Click the file you want to reload.

Note: When reloading a file the file format is used, by which the file was lastly loaded/saved.

### File / Reload project

Choose this option to reload a recently used project.

When you use a project, it is added to the **Reload project** list. Projects are listed in order depending on time of use of them. Lastly used projects are listed before projects used far off.

To Reload a project:

1. From the File menu, choose Reload project.

2. List of lastly used projects is displayed. Click the project you want to reload.

# File / Project options

This option is used for display/edit project options of actually loaded project. Project options mean basic description of project including following project data:

- device name and manufacturer
- project creation date
- user defined project description (arbitrary text), e.g. project author and other text data for more detailed project description

User can directly edit user defined project description only. Device name, manufacturer, project date and program version are generated automatically by program.

# File / Load encryption table

This command loads the data from binary file from disk and it saves them into the part of memory, reserved for an encryption (security) table.

### File / Save encryption table

This command writes the content of the memory's part, reserved for an encryption table, into the file on the disk as a binary data.

# File / Exit without save

The command deallocates heap, cancels buffer on disk (if exists) and returns back to the operation system.

# File / Exit and save

The command deallocates heap, cancels buffer on the disk (if exists), saves current setting of recently selected devices to disk and returns back to the operation system.

# Buffer

Menu **Buffer** is used for buffer manipulation, block operation, filling a part of buffer with string, erasing, checksum and of course editing and viewing with other items (find and replace string, printing...).

# Buffer / View/Edit

This command is used for **view** (view mode) or **edit** (edit mode) data in buffer (for viewing in DUMP mode only). Use arrow keys for select the object for edit. Edited data are signified by color.

You can use <F4> hot key also.

### View/Edit Buffer

F1	display help of actual window
F2	fill block causes filling selected block of buffer by requested hex (or ASCII)
	string. Sets start and end block for filling and requested hex or ASCII string.
Ctrl+F2	erase buffer with specified blank value
Ctrl+Shift+F2	fill buffer with random data
F3	copy block is used to copy specified block of data in current buffer on new
	address. Larget address needn't be out from source block addresses.
F4	move block is used to move specified block of data in current buffer on new
	address. Target address needn't be out from source block addresses.
F.F.	Source address block (or part) will be filled by topical blank character.
гэ	swap bytes command swaps a high- and low- order of byte pairs in current
	burner block. This block must start on even address and must have an even
	number of bytes. If these conditions do not fulfill, the program modifies
	addresses itself (start address is moved on lower even address and/or end
	address is moved on higher odd address).
F6	print buffer
F7	find string (max. length 16 ASCII characters)
F8	find and replace string (max. 16 ASCII chars.)
F9	change current address
F10	change mode view / edit
F11	switch the mode of buffer data view between 8 bit and 16 bit view. It can be
	also doing by mouse clicking on the button to the right of View/Edit mode
	buffer indicator. This button indicates actual data view mode (8 bit or 16
	bit), too
F12	checksum dialog allows to count checksum of selected block of buffer
	change mode view / edit

Arrow keysmove cursor up, down, right and leftHome/Endjump on start / end current linePgUp/PgDnjump on previous / next pageCtrl+PgUp/PgDnjump on start / end current pageCtrl+Home/Endjump on start / end current deviceShift+Home/Endjump on start / end current bufferBackspacemove cursor one position left (back)

**Note:** characters 20H - FFH (mode ASCII) and numbers 0..9, A..F (mode HEX) immediately changes content of edit area.

Warning: Editing of ASCII characters for word devices is disabled.

### Print buffer

This command allows write selected part of buffer to printer or to file. Program uses at it an external text editor in which selected block of buffer is displayed and can be printed or saved to file, too. By default is set simple text editor **Notepad.exe**, which is standard part of all versions of Windows.

In Print buffer dialog are following options:

#### Block start

Defines start address of selected block in buffer.

#### Block end

Defines end address of selected block in buffer.

#### External editor

This item defines path and name of external program, which has to be used as text viewer for selected block of buffer. By default is set simple text editor Notepad.exe, which is standard part of all versions of Windows. User can define any text editor for example Wordpad.exe, which is able to work with large text files. In user defined text editor user can print or save to file selected block of buffer.

The external editor path and name is saved automatically to disk.

#### Find dialog box

Enter the search string to **Find** to text input box and choose **<Find>** to begin the search or choose **<Cancel>** to forget it.

**Direction** box specifies which way you want to search, starting from the current cursor position (In edit mode). **Forward** (from the current position or start of buffer to the end of the buffer) is the default. **Backward** searches toward the beginning. In view mode searches all buffer.

Origin specifies where the search should start.

### Find & Replace dialog box

Enter the search string in the **Text to find** string input box and enter the replacement string in the **Replace with** input box.

In **Options** box you can select prompt on replace: if program finds instance you will be asked before program change it.

Origin specifies where the search should start.

**Direction** box specifies which way you want to search, starting from the current cursor position (In edit mode). **Forward** (from the current position or start of buffer to the end of the buffer) is the default. **Backward** searches toward the beginning. In view mode searches all buffer.

Press **<Esc>** or click **Cancel** button to close dialog window.

By pressing **Replace** button the dialog box is closed and a Question window is displayed. This window contains following choices:

Yes replaces found item and finds next

No finds next item without replacing current one

Replace All replaces all found items

Abort search aborts this command

### View/Edit buffer for PLD

Ctrl+F2 Ctrl+Shift+F2 F9 F10 F11	erase buffer with specified blank value fill buffer with random data go to address change mode view / edit switch the mode of buffer data view between 1 bit and 8 bit view. It can be also doing by mouse clicking on the button to the right of View/Edit mode buffer indicator. This button indicates actual data view mode (1 bit or 8 bit) too
Arrow keys	in ove cursor up, down, right and left
Home/End	jump on start / end current line
PgUp/PgDn	jump on previous / next page
Ctrl+PgUp/PgDn	jump on start / end current page
Ctrl+Home/End	jump on start / end edit area
Backspace	move cursor one position left (back)

Note: Characters 0 and 1 immediately changes content of edit area.

# Buffer / Fill block

Selecting this command causes filling selected block of buffer by requested hex (or ASCII) string. Sets start and end block for filling and requested hex or ASCII string.

# Buffer / Copy block

This command is used to copy specified block of data in current buffer on new address. Target address needn't be out from source block addresses.

# Buffer / Move block

This command is used to move specified block of data in current buffer on new address. Target address needn't be out from source block addresses. Source address block (or part) will be filled by topical blank character.

# Buffer / Swap block

This command swaps a high- and low- order of byte pairs, foursomes or nibbles inside bytes depending on swap mode selected by user. Swap operation is performed on buffer block specified by Start and End addresses. This block must start on even address and must have an even number of bytes. If the conditions do not fulfill, the program modifies addresses itself

(start address is moved on lower even address and/or end address is moved on higher odd address).

Following swap modes are available, user can select from:

- 1. Swap 2-bytes inside 16-bit words swap of byte pairs inside 16-bit words.
- 2. Swap 4-bytes inside 32-bit words swap of byte foursomes inside 32-bit words.
- 3. Swap nibbles inside bytes swap of high- and low- nibbles inside each byte.

Examples of swap operation in buffer:

Swap bytes operation from Start address 0 to End address N modifies data in buffer by following tables:

Address	Original	Swap 2-bytes	Swap 4-bytes	Swap nibbles
	Data	inside 16-bit words	inside 32-bit words	inside bytes
0000h	b0	b1	b3	b0m
0001h	b1	b0	b2	b1m
0002h	b2	b3	b1	b2m
0003h	b3	b2	b0	b3m
0004h	b4	b5	b7	b4m
0005h	b5	b4	b6	b5m
0006h	b6	b7	b5	b6m
0007h	b7	b6	b4	b7m

b0, b1, b2, ... means original buffer byte values from addresses 0, 1, 2, ... b0m, b1m, b2m, ... means nibble-swapped original bytes b0, b1, b2, ... by following rules:

Original Byte bits	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
Nibble-swapped Byte Bits	bit 3	bit 2	bit 1	bit 0	bit 7	bit 6	bit 5	bit 4

### Buffer / Erase

If this command is selected, the content of the buffer will be filled with topical blank character.

The reserved key **<Ctrl+F2>** will bring out this menu from any menu and any time.

### Buffer / Fill random data

If this command is selected, the content of the buffer will be filled with random data.

The reserved key **<Shift+Ctrl+F2>** will bring out this menu from any menu and any time.

### Buffer / Duplicate buffer

This command performs duplicate buffer content in range of source EPROM to range of destination EPROM. This procedure is suitable if there is used for example 27C512 EPROM to 27C256 EPROM position.

Note: The procedure always uses buffer start address 00000h.

# Buffer / Checksum

Checksum of data stored in buffer of Pg4uw is useful to check the data are correct. Pg4uw contains following functions according to checksum:

- Automatic checksum calculator with Main checksum value displayed in main window of Pg4uw in table Addresses and in Log window of Pg4uw
- On-demand checksum calculator that can calculate and display various types of checksums of various data blocks in buffer.

Settings for Automatic checksum calculator and on-demand checksum calculator are available in dialog **Checksum**.

Dialog Checksum contains two tabs (panels):

- Tab Main checksum options
- Tab Checksum calculator

**Tab Main checksum options** allows to set mode of **Automatic checksum calculator**. It contains following controls:

- Checkbox Apply user-defined buffer addresses for main checksum
  - unchecked status global Buffer start and Buffer end address is used for calculating checksum of buffer data
  - checked status user defined addresses are used to calculate checksum of buffer data
- Fields From address and To address are used to enter address range for main checksum calculation. Addresses are used only when checkbox Apply user-defined buffer addresses for main checksum is checked.
- Selection group **Checksum type** allows selecting wished kind of checksum to be used for main checksum. More information about **Main checksum** types can be found bellow.
- Field Checksum contains actual value of recently calculated checksum
- Button **Apply** is used to confirm checksum settings from Main checksum options. Please note, that once the button is pressed, previous checksum settings are lost.
- Button Close is used to close the Checksum dialog.
- Group Exclude buffer data for checksum contains options for specifying blocks of buffer data, which have to be excluded from checksum calculation. This is useful for example for serialization. Serialization modifies data at specified addresses in buffer. So there is problem to check the checksum of buffer, when data on some addresses are changed by serialization engine before programming of each device. If part of buffer used for serialization is excluded from checksum calculation, the checksum of buffer data will not be changed by serialization data changes. One or more excluded blocks can be specified.

Tab **Checksum calculator** contains on-demand checksum calculator. It contains following controls:

- From address This is a start address of block selected for calculating checksums in buffer. Address is always defined as Byte address.
- To address This is an end address of block selected for calculating checksums in buffer. Address is always defined as Byte address.
- Fields displaying values of calculated checksum types:
- **BYTE** sum by bytes to DWORD. CY flag is ignored.

WORD	sum by words to DWORD. CY flag is ignored.
BYTE (CY)	sum by bytes to DWORD. CY flag is added to result.
WORD (CY)	sum by words to DWORD. CY flag is added to result.
CRC-CCITT	sum by bytes to Word using RESULT=PREVIOUS + (x^16 + x^12 + x^5 +1)
CRC-XMODEM	sum by bytes to Word using RESULT=PREVIOUS + (x^16 + x^15 + x^2 +1)

**CRC-32** sum by bytes to DWORD using standard CRC-32 algorithm Column marked as **NEG**. is a negation of checksum so, that SUM + NEG. = FFFFH. Column marked as **SUPPL.** is complement of checksum so, that SUM + SUPPL. = 0 (+ carry).

Word is 16-bit word. DWORD is 32-bit word.

#### Supported hash sums:

**MD5** an MD5 hash expressed as a sequence of 32 hexadecimal digits (128 bits)

SHA-1 "Secure Hash Standard" expressed as a sequence of 40 hexadecimal digits (160 bits)

#### • Insert checksum options box.

This box contains following options for Calculate & insert operation:

#### Insert checksum

Kind of checksum that is written into the buffer when, the **Calculate & insert** operation was executed.

#### Insert address

Address in buffer where a result of chosen checksum is written, when the **Calculate & insert** was executed. Address can not be specified inside the range **<From address>** to **<To address>**. Address is always defined as Byte address.

Size

Size of chosen checksum result, which will be written into the buffer. A size of inserted checksum may be **Byte** (8-bit), **Word** (16-bit) or **DWORD** (32-bit). If size is smaller then selected checksum size, only lower byte(s) of checksum value will be written into the buffer.

**Note:** If Word size was selected, a low byte of checksum value will be written on address specified in box Insert address and a high byte will be written on address incremented by one. Similarly it is for DWORD.

#### • Byte order mode for Word and Word (CY) checksums box

This box contains setting of byte orientation in words summed for Word and Word (CY) checksums.

Available settings are Little endian and Big Endian. Description of both settings is in section Word sum Little Endian (x16) and Word sum Big Endian (x16) of Automatic checksum calculator help.

#### Calculate button

Click on the button Calculate starts calculating checksums for selected block in buffer. No writes into the buffer are executed.

• Calculate & insert button

Click on the button Calculate & insert starts calculating checksums for selected block in the buffer and writes the chosen checksum into the buffer on address specified by Insert address. This function is available for Byte, Word, CRC-CCITT and CRC-XMODEM checksums.

 Close button Closes dialog Checksum.

#### Main checksum types

Checksum value displayed in main program window in table "Addresses" shows sum of current data in main buffer. Sum is calculated with following rules:

- Address range of data block the checksum is calculated, can be set to one of two modes:
  - Default addresses "Buffer Start" and "Buffer End", that are displayed in table "Addresses" in the main program window.

• Custom defined addresses.

The settings are available in dialog **Checksum**, tab Main checksum options, check box **Use custom defined buffer addresses for checksum calculation**. Custom checksum address mode is indicated as [addrfrom..addrto] string displayed after checksum value in main program window in table "Addresses".

Checksum address range settings are associated to currently selected device only. After new device is selected, address range is set to default addresses mode "Buffer Start" and "Buffer End" for selected device. Checksum address mode is also saved to project files.

• Following checksum types are available for Main checksum:

#### Byte sum (x8)

Buffer data are summed byte-by-byte irrespective of current buffer view mode (x8/x16/x1) organization. Any carry bits exceeding 32-bits are neglected. This checksum mode is indicated by string (x8) displayed after checksum value in main program window.

#### Word sum Little Endian (x16)

Buffer data are summed word-by-word irrespective of current buffer view mode organization. Any carry bits exceeding 32-bits are neglected. This checksum mode is indicated by string (x16 LE) displayed after checksum value in main program window. Term Little Endian means, the buffer checksum is calculated from words read from buffer in Little Endian mode.

#### Word sum Big Endian (x16)

Buffer data are summed word-by-word irrespective of current buffer view mode organization. Any carry bits exceeding 32-bits are neglected. This checksum mode is indicated by string (x16 BE) displayed after checksum value in main program window. Term Big Endian means, the buffer checksum is calculated from words read from buffer in Big Endian mode.

#### CRC-CCITT

Buffer data are summed by bytes to 16-bit word using standard CRC-CCITT algorithm RESULT=PREVIOUS +  $(x^{16} + x^{12} + x^{5} + 1)$ 

#### CRC-XMODEM

Buffer data are summed by bytes to 16-bit word using standard CRC-XMODEM algorithm RESULT=PREVIOUS +  $(x^{16} + x^{15} + x^{2} + 1)$ 

#### CRC-32

Buffer data are summed by bytes to 32-bit word using standard CRC-32 algorithm.

#### MD5 and SHA-1

Buffer data are summed by MD5 or SHA-1 hash-sum algorithms.

The checksum modes can be set in pop-up menu by clicking on label checksum in main program window or by menu shortcuts **Shift+Ctrl+1** for Byte sum (x8), **Shift+Ctrl+2** for Word sum Little Endian (x16) or Shift+Ctrl+3 for Word sum Big Endian (x16) etc.. Options are also available in dialog **Checksum**, tab **Main checksum options**.

Checksum type is saved to configuration file and project file. Setting from project file has higher precedence.

# Device

Menu **Device** includes functions for a work with selected programmable devices - device select, read data from device, device blank check, device program, device verify and device erase.

### Device / Select from default devices

This window allows selecting the desired type of the device from list of default devices. This one is a cyclic buffer in which are stored recently selected devices including their device options. This list is saved to disk by command **File / Exit and save**.

If you wish display additional information about the current device, use an **<Ctrl+F1**> key. This command provides a size of device, organization, programming algorithm and a list of programmers (including auxiliary modules) that supported this device. You can find here package information and other general information about current device too.

Use a **<Del>** key for delete of current device from list of default devices. There isn't possible to empty this list, if you repeat this access. The last device stays in buffer and the **<Del>** key isn't accepted.

### Device / Select device...

This window allows selecting the desired type of the device from all devices supported by current programmer. It is possible to choose device by **name**, by **type** or by **manufacturer**.

**Note 1:** The names of the programmable devices in software don't contain all characters, shown at the top of the chip or mentioned in the datasheet section part numbering. The names contain all characters necessary to identification of the device, but don't contain such codes, that have none influence to the programming, for example temperature code, speed code, packing type code, etc.. If such code letter is at the end of the name, is omitted, if such code letter is in the middle of name, then is replaced by character 'x'.

Examples:

- Devices Am27C512-150, Am27C512-200 and Am27C512-250 are shown in the software only once, as Am27C512
- S29GL064N11TF1010 device is shown in the software as S29GL064NxxTxx01

**Note 2:** If some device is listed twice and the second time with suffix x16, it means, that programming algorithm provides faster word mode.

Selected device is automatically saved to buffer of default devices. This buffer is accessible with **Device / Select from default devices** command.

In the **Search mask** field you can enter mask for filtering of whole device list by device name, manufacturer and/or programming adapter names. The space as delimiter of filter items (fragments) has "OR" function. If you want to enter exact filter string including spaces, use quotation mark character ".

If you wish display additional information about the current device, use button **Device info** or an **<Ctrl+F1>** key. This command provides a size of device, organization, programming algorithm and a list of programmers (including auxiliary modules) that supported this device. You can find here package information and other general information about current device too.

The currently displayed device list can be saved to text file by pressing button **Save currently displayed list to file**.

### Select device ... / All

This window allows selecting the desired type of the device from all devices supported by current programmer. Supported devices are displayed in a list box.

Device can be select by double click on a line from list with desired manufacturer name and device number or by entering manufacturer name and/or device number in a search box (use a key **<Space>** as a separation character) and press **<Enter>** or click **OK** button.

Press a key **<Esc>** or click **Cancel** button at any time to cancel device selection without affecting the currently selected device.

Selected device is automatically saved to buffer of default devices. This buffer is accessible with **Device / Select from default devices** command.

If you wish display additional information about the current device, use button **Device info** or an **<Ctrl+F1>** key. This command provides a size of device, organization, programming algorithm and a list of programmers (including auxiliary modules), which supported this device. You can find here package information and other general information about current device too.

### Select device ... / Only selected type

This window allows selecting the desired type of the device. At the first - you must select a device type (e.g. EPROM) and device subtype (e.g. 64Kx8 (27512)), using mouse or cursor keys. It will cause a list of manufacturers and devices will be displayed.

Device can be select by double click on a line from list with desired manufacturer name and device number or by entering manufacturer name and/or device number in a search box (use a key **<Space>** as a separation character) and press **<Enter>** or click **OK** button.

Press a key **<Esc>** or click **Cancel** button at any time to cancel device selection without affecting the currently selected device.

Selected device is automatically saved to buffer of default devices. This buffer is accessible with **Device / Select from default devices** command.

If you wish display additional information about the current device, use button **Device info** or an **<Ctrl+F1>** key. This command provides a size of device, organization, programming algorithm and a list of programmers (including auxiliary modules) that supported this device.

You can find here package information and other general information about current device too.

### Select device ... / Only selected manufacturer

This window allows selecting the desired device type by manufacturer. First select a required manufacturer in Manufacturer box using mouse or cursor keys. It will cause a list of selected manufacturer devices will be displayed.

Device can be select by double click on a line from list with desired manufacturer name and device number or by entering device number in a search box (use a key **<Space>** as a separation character) and press **<Enter>** or click **OK** button.

Press a key **<Esc>** or click **Cancel** button at any time to cancel device selection without affecting the currently selected device.

Selected device is automatically saved to buffer of default devices. This buffer is accessible with **Device / Select from default devices** command.

If you wish display additional information about the current device, use button **Device info** or an **<Ctrl+F1>** key. This command provides a size of device, organization, programming algorithm and a list of programmers (including auxiliary modules) that supported this device. You can find here package information and other general information about current device too.

## Device / Select EPROM /Flash by ID

Use this command for autoselect an EPROM or Flash as active device by reading the device ID. The programmer can automatically identify certain devices by the reading the manufacturer and the device-ID that are burnt into the chip. This only applies to EPROM or Flash that supports this feature. If the device does not support a chip ID and manufacturer's ID, a message will be displayed indicating this as an unknown or not supported device.

If more devices with identical chip ID and manufacturer's ID were detected, the list of these devices will be displayed. A corresponding device can be chosen from this list by selecting its number (or manufacturer name) from list and press **<Enter>** (or click **OK** button). Press a key **<Esc>** or click **Cancel** button at any time to cancel device selection without affecting the currently selected device.

**Warning:** The control program only support this time EPROM's and Flash with 28 and 32 pins. Any of programmers determines pins number automatically. For other programmers you must enter this number manually.

The programmer applies a high voltage to the appropriate pins on the socket. This is necessary to enable the system to read the device ID. Do not insert into the socket a device that is not an EPROM or Flash. It may be damaged when the programmer applies the high voltage.

We don't recommend apply this command to 2764 and 27128 EPROM types, because most of them ID not supports.

# Device / Device options

All settings of this menu are used for programming process, serialization and associated file control.

### Device / Device options / Operation options

All settings of this command are used for programming process control. This is a flexible environment, which content items associated with current device and programmer type. Items, which are valid for the current device but aren't supported by current programmer, are disabled. These settings are saving to disk along with associated device by **File / Exit and save** command.

The commonly used term are also explained in the user's manual to programmer. The special terms used here are exactly the terms used by manufacturer of respective chip. Please read the documentation to the chip you want to program for explanation of all used terms.

#### List of commonly used items:

group Addresses:

device start address	(default 0)
device end address	(default device size-1)
buffer start address	(default 0)
Split	(default none)

Split (default none)

This option allows setting special mode of buffer when programming or reading device. Using split options is particularly useful when using 8-bit data memory devices in 16-bit or 32-bit applications.

Following table describes buffer to device and device to buffer data transfer

Split type	Device	Buffer Address assignment
None	Device[ADDR]	Buffer[ADDR]
Even	Device[ADDR]	Buffer[2*ADDR]
Odd	Device[ADDR]	Buffer[1+(2*ADDR)]
1./4	Device[ADDR]	Buffer[4*ADDR]
2./4	Device[ADDR]	Buffer[1+(4*ADDR)]
3./4	Device[ADDR]	Buffer[2+(4*ADDR)]
4./4	Device[ADDR]	Buffer[3+(4*ADDR)]

Real addressing will be following: (all addresses are hexadecimal)

Split type	Device addresses	Buffer addresses
None	00 01 02 03 04 05	00 01 02 03 04 05
Even	00 01 02 03 04 05	00 02 04 06 08 0A
Odd	00 01 02 03 04 05	01 03 05 07 09 0B
1./4	00 01 02 03 04 05	00 04 08 0C 10 14
2./4	00 01 02 03 04 05	01 05 09 0D 11 15
3./4	00 01 02 03 04 05	02 06 0A 0E 12 16
4./4	00 01 02 03 04 05	03 07 0B 0F 13 17

Terms explanation:

Access to device address ADDR is written as Device[ADDR]. Access to buffer address ADDR is written as Buffer[ADDR]. ADDR value can be from zero to device size (in bytes). All addresses are byte oriented addresses.

#### group Insertion test:

#### insertion test (default ENABLE)

If enabled, the programmer checks all pins of the programmed chip, if have proper connection to the ZIF socket (continuity test). The programmer is able to identify the wrong contact, misinserted chip and also (partially) backinserted chip.

Device ID check error terminates the operation (default ENABLE)

Programmer provides ID check before each selected action. It compares read ID codes from device with ID codes defined by device manufacturer. In case of ID error, control program behaves as follows:

- if item is set to ENABLE, selected action is finished
- if item is set to DISABLE, selected action continues. Control program just writes warning message about ID error to LOG window.

If enabled, the programmer checks the electronic ID of the programmed chip.

#### Note 1: Some old chips don't carry electronic ID.

**Note 2:** In some special cases, several microcontrollers don't provide ID, if copy protection feature in the chip is set, even if device ID check setting in control program is set to "Enable".

#### group Command execution:

blank check before programming	(default DISABLE)
erase before programming	(default DISABLE)
verify after reading	(default ENABLE)
verify	(ONCE, TWICE)
verify options	(nominal VCC +/-5%
	nominal VCC +/-10%
	VCCmin - VCCmax)

#### group Target system power supply parameters

This group is available in ISP mode for some types of devices. It contains following settings: **Enable target system power supply** - enables supplying of target system from programmer. Supply voltage for target system is switched on before action with programmed device and is switched off after action finished. If Keep ISP signals at defined level after operation is enabled, then programmer will switch off supply voltage after pull-up/pull-down resistors are deactivated.

Voltage - supply voltage for target system. Supply voltage range is from 2V to 6V.

**Note:** The voltage value given to target system depends also on current flowing to target system. To reach exact voltage supply for target system, the proper Voltage and Max. current values has to be defined. The Max. current value specified has to be as exact as possible equal to real current consumption of target system.

**Max. current** - maximum current consumption of powered target system. Current consumption range is from 0 to 300mA

**Voltage rise time** - determines skew rate of rising edge of target system power supply voltage (switch on supply voltage).

**Target supply settle time** - determines time, after which must be supply voltage in target system stabilized at set value and target system is ready to any action with programmed device.

**Voltage fall time** - determines skew rate of falling edge of target system power supply voltage (switch off supply voltage).

**Power down time** - determines time after switch off target system power supply within target system keeps residual supply voltage (e.g. from charged capacitor). After this time elapsed target system has to be without supply voltage and can be safely disconnected from programmer.

#### group Target system parameters

This group is available in ISP mode for some types of devices. It contains following settings: **Oscillator frequency** (in Hz) - oscillator's frequency of device (in target system). Control program sets programming speed by its, therefore is necessary set correct value.

**Supply voltage** (in mV) - supply voltage in target system. Control program checks or sets (it depends on programmer type) entered supply voltage in target system before every action on device.

**Disable test supply voltage** - disables measure and checking supply voltage of programmed device, set in Supply voltage edit box, before action with device.

**Delay after reset active** - this parameter determine delay after Reset signal active to start action with device. This delay depends on values of used devices in reset circuit of device and can be chosen from these values: 10ms, 50ms, 100ms, 500ms or 1s.

**Inactive level of ISP signals** - this parameter determine level of ISP signals after finishing access to target device. Signals of ISP connector can be set to Pull-up (signals are tied through 22k resistors to supply voltage) or Pull-down (signals are tied through 22k resistors to ground).

Keep ISP signals at defined level after operation - enables keeping set level of ISP signals after access to target device finished. Control program indicates activated pull-up/pull-down resistors by displaying window with warning. After user close this window control program will deactivate resistors.

#### group Programming parameters

This group is available for some types of devices. It contains settings of which device parts or areas has to be programmed.

#### group Erase parameters

This group is available for some types of devices. It contains special settings of erase modes of selected device.

### Device / Device options / Serialization

Serialization is special mode of program. When a serialization mode is activated, a specified value is automatically inserted on predefined address into buffer before programming each

device. When more devices are programmed one by one, the serial number value is changed for each device automatically and inserted into buffer before programming device, so each device has unique serial number.

There are three types of serialization:

- Incremental mode
- From file mode
- Custom generator mode

Dialog **Serialization** contains also settings for associated serialization position files that are used with project files with serialization turned on. For more detailed information about using serialization in project files, look at Serialization and projects.

#### Basic rules of serialization:

If a new device is selected, the serialization function is set to a default state i.e. disabled. Actual serialization settings for actually selected device are saving to disk along with associated device by **File / Exit and save** command.

When incremental mode is active following actual settings are saved to configuration file: address, size, serial value, incremental step and settings of modes ASCII / BIN, DEC / HEX, LS byte / MS Byte first.

When from-file mode is active following actual settings are saved to configuration file: name of input serialization file and actual label, which indicates the line with actual serial number in input file.

When program is in multiprogramming mode (multiple socket programmer is actually selected) the special section - **Action on not programmed serial values due to error** - is displayed in dialog **Serialization**. In this section two choices are available:

- Ignore not programmed serial values
- Add not programmed serial values to file

**Ignore not programmed serial values** means the not programmed serial values are ignored and no action is done with them.

Add not programmed serial values to file means the not programmed serial values are added to file. The file of not programmed serial values has the same text format as serialization file for "From-file" serialization mode. So there is possible to program the serial values later on by "From-file" serialization mode.

**Notes:** If device programming is stopped by user, program will not change the serial values ready for next batch of devices. The same situation is if device program is incomplete, e.g. for device insertion test error.

Ignoring or writing not programmed serial values is only used when at least one device from current batch of devices in multiple socket module programmer is completely programmed and verified without errors.

Serialization can work with control program's main buffer or extended buffers available for some types of devices, for example Microchip PIC16Fxxx devices with Data EEPROM Memory. The selection which buffer has to be used by serialization routine is available in

dialog Serialization. The extended buffer selection is ignored for From-file serialization in playlist file mode. For more details about this limitation, see the **From file mode** serialization mode description please.

If you wish to exclude serialization data from main checksum automatic calculation, you can use **Exclude buffer data for checksum** feature available in dialog Checksum in tab **Main checksum options**.

### Device / Device options / Serialization / Incremental mode

The Incremental mode enables to assign individual serial numbers to each programmed device. A starting number entered by user will be incremented by specified step for each device program operation and loaded in selected format to specified buffer address prior to programming of each device.

There are following options, that user can modify for incremental mode:

#### S / N size

S / N size option defines the number of bytes of serial value which will be written to buffer. For Bin (binary) serialization modes values 1-8 are valid for S / N size and for ASCII serialization modes values 1-16 are valid for S / N size.

#### Address

Address option specifies the buffer address, where serial value has to be written. Note that address range must be inside the device start and device end addresses. Address must be correctly specified so the last (highest or lowest) byte of serial value must be inside device start and device end address range.

#### Start value

Start value option specifies the initial value, from which serialization will start. Generally, the max. value for serialization is \$1FFFFFF in 32 bit long word.

When the actual serial value exceeds maximum value, three most significant bits of serial number are set to zero. After this action the number is always inside 0..\$1FFFFFF interval (this is basic style of overflow handling).

#### Step

Step options specify the increment step of serial value incrementation.

#### S / N mode

S / N mode option defines the form in which serial value has to be written to buffer. Two options are available:

- ASCII
- Bin

**ASCII** - means the serial number is written to buffer as ASCII string. For example number \$0528CD is in ASCII mode written to buffer as 30h 35h 32h 38h 43h 44h ('0' '5' '2' '8' 'C' 'D'), i.e. six bytes.

**Bin** - means the serial number is written directly to buffer. If the serial number has more than one byte length, it can be written in one of two possible byte orders. The byte order can be changed in "Save to buffer" item.

#### Style

Style option defines serial number base. There are two options:

Decimal

#### Hexadecimal.

**Decimal** numbers are entered and displayed using the characters '0' through '9'. **Hexadecimal** numbers also use characters 'A' through 'F'.

The special case is Binary Dec, which means BCD number style. BCD means the decimal number is stored in hexadecimal number, i.e. each nibble must have value from 0 to 9. Values A to F are not allowed as nibbles of BCD numbers.

Select the base in "Style" options before entering numbers of serial start value and step.

#### Save to buffer

Save to buffer option specifies the serial value byte order to write to buffer. This option is used for Bin S / N mode (for ASCII mode it has no effect).

Two options are available:

- LSByte first (used by Intel processors) will place the Least Significant Byte of serial number to the lowest address in buffer.
- MSByte first (used by Motorola processors) will place the Most Significant Byte first to the lowest address in buffer.

#### Split serial number at every N byte(s)

The option allows dividing serial number into individual bytes and placing the bytes at each Nth address of buffer. This feature is particularly useful for example for Microchip PIC devices when the device serial number can be the part of program memory as group of RETLW instructions. The example of using serial number split is listed in section Examples bellow as example number 2.

#### Example:

#### Example 1:

Write serial numbers to AT29C040 devices at address 7FFFAH, size of serial number is 4 bytes, start value is 16000000H, incremental step is 1, the serial number form is binary and least significant byte is placed at the lower address of serial number in device.

To make above described serialization following settings have to be set in Serialization dialog:

Mode: Incremental mode S/N size: 4 bytes S/N mode:: Bin Style: Hex Save to buffer: LS Byte first Address: 7FFFCH Start value: 16000000H Step: 1 Following values will be written to device: The 1st device Address Data The 2nd device Address Data 007FFF0 xx 01 00 00 16 The 3rd device Address Data

007FFF0 xx 02 00 00 16 etc.

"xx" mean user data programmed to device

Serial numbers are written to device from address 7FFFCH to address 7FFFFH because serial number size is 4 bytes.

#### Example 2:

Following example shows usage of SQTP serialization mode when serial number is split into RETLW instructions for Microchip PIC16F628 devices.

**Note:** Serial quick turn programming (SQTP) is Microchip specified standard for serial programming of Microchip PIC microcontrollers. Microchip PIC devices allows you to program a unique serial number into each microcontroller. This number can be used as an entry code, password, or ID number.

Serialization is done by using a series of RETLW (Return Literal W) instructions, with the serial number bytes as the literal data. To serialize, you can use Incremental mode serialization or From file mode serialization.

Incremental serialization offers serial number Split function. Serial number split allows usage of incremental numbers separated into even or odd bytes and between each byte of serial number RETLW instruction code is inserted.

From file serialization is using proprietary serial numbers file. This file can consist of various serial numbers. The numbers can have format suitable for SQTP that means number RETLW b1 RETLW b2 and so on. Note that Pg4uw serial file format is not compatible with SQTP serial file generated by Microchip MPLAB.

Device PIC16F628 has 14 bit wide instruction word. Instruction RETLW has 14-Bit Opcode:

Description MSB 14-Bit word LSB RETLW Return with literal in W 11 01xx kkkk kkkk

where xx can be replaced by 00 and k are data bits, i.e. serial number byte

Opcode of RETLW instruction is hexadecimal 34KKH where KK is data Byte (serial number byte)

Let's assume we want to write serial number 1234ABCDH as part of four RETLW instructions to device PIC. The highest Byte of serial number is the most significant Byte. We want to write the serial number to device program memory at address 40H. Serial number split us very useful in this situation. Serialization without serial number split will write the following number to buffer and device:

**Note:** address 80H is because buffer has byte organization and PIC has word organization so it has equivalent program memory address 40H. When buffer has word organization x16, the address will be 40H and number 1234ABCDH will be placed to buffer as following:

Address Data

Pa4uw

0000040 ABCD 1234 XXXX XXXX XXXX XXXX XXXX XXXX XXXX

We want to use RETLW instruction so buffer has to be:

Address Data 0000040 34CD 34AB 3434 3412 xxxx xxxx xxxx xxxx xxxx

We can do this by following steps:

**A)** write four RETLW instructions at address 40H to main buffer (this can be done by hand editing buffer or by loading file with proper content). The bottom 8 bits of each RETLW instruction are not important now, because serialization will write correct serial number bytes at bottom 8 bits of each RETLW instruction.

The buffer content before starting device program will look for example as following:

Address	Data
0000040	3400 3400 3400 3400 xxxx xxxx xxxx xxxx

8 bits of each RETLW instructions are zeros, they can have any value.

**B)** Set the serialization options as following:

,	
S/N size:	4 Bytes
Address:	40H
Start value:	1234ABCDH
Step:	1
S/N mode:	BIN
Style:	HEX
Save to buffer:	LS Byte first
Check the option	"Split serial number at every N byte(s)" and split value N set to 2.
(It means split of	serial number to buffer at every second Byte)

The correct serial number is set tightly before device programming operation starts. The buffer content of serial number when programming the first device is:

Address Data 0000040 34CD 34AB 3434 3412 xxxx xxxx xxxx xxxx xxx

That's it.

Example 3:

Following example uses the same serialization options as Example number 2, instead the serial number split is set to 3 and 4.

When "Split serial number at every 3 byte(s)" is set, the buffer content will look as:

Byte buffer organization: Address Data 0000080 CD xx xx AB xx xx 34 xx xx 12 xx xx xx xx xx xx

Word16 buffer organization: Address Data

0000040 xxCD ABxx xxxx xx34 12xx xxxx xxxx xxxx

When "Split serial number at every 4 byte(s)" is set, the buffer content will look as:

Byte buffer organization: Address Data

0000080 CD xx xx xx AB xx xx xx 34 xx xx xx 12

Word16 buffer organization:

Address Data

0000040 xxCD xxxx xxAB xxxx xx34 xxxx xx12 xxxx

**Note:** When you are not sure about effects of serialization options, there is possible to test the real serial number, which will be written to buffer. The test can be made by following steps:

- 1. select wished serialization options in dialog Serialization and confirm these by OK button
- 2.in dialog Device operation options set Insertion test and Device ID check (if available) to Disabled
- 3. check there is no device inserted to programming module ZIF socket
- 4.run Device Program operation (for some types of devices it is necessary to select programming options before programming will start)
- 5.after completing programming operation (mostly with some errors because device is not present) look at the main buffer (View/Edit buffer) at address where serial number should be placed

**Note:** Address for Serialization is always assigned to actual device organization and buffer organization that control program is using for current device. If the buffer organization is byte org. (x8), the Serialization Address will be byte address. If the buffer organization is wider than byte, e.g. 16 bit words (x16), the Serialization Address will be word address.

#### Device / Device options / Serialization / Classic From file mode

When you use a **Classic From-file mode** the serialization file has serial values directly included. Serialization data are then read directly from serialization file to buffer on address specified in the file. Classic From-file mode is indicated in main window and info window of Pg4uw control program on panel "Serialization" as "**From-file**" serialization. There are two user options:

#### Start label

Start label defines the start label in input file. The reading of serial values from file starts from defined start label.

#### File name

File name option specifies the file name from which serial addresses and values will be read. The input file for Classis From file serialization must have correct format.

#### File format

Classic From-file serialization input file has text format. The file includes addresses and arrays of bytes defining buffer addresses and data to write to buffer. Input file has text type format, which structure is:

[label1] addr byte0 byte1 .. byten

[labeln] addr byte0 byte1 .. bytem , addr byte0 byte1 ... bytek

; Comment

meaning is:

#### basic part

Basic part defines buffer address and array of bytes to write to buffer. Basic part must be always defined after label in line.

#### optional part

Optional part defines the second array of bytes and buffer address to write to buffer. One optional part can be defined after basic part of data.

#### label1, labeln - labels

Labels are identifiers for each line of input file. They are used for addressing each line of file. The labels should be unique. Addressing lines of file means, the required start label entered by user defines line in input file from which serial values reading starts.

#### addr -

Addr defines buffer address to write data following the address.

#### byte0..byten, byte0..bytem, byte0..bytek -

Bytes arrays byte0..byten, byte0..bytem and byte0..bytek are defining data, which are assigned to write to buffer. Maximum count of bytes in one data field following the address is 64 bytes. Data bytes are written to buffer from address addr to addr+n.

The process of writing particular bytes to buffer is:

```
byte0 to addr
byte1 to addr + 1
byte2 to addr + 2
....
byten to addr + n
```

**Optional part** is delimited from the first data part by character ", " (comma) and its structure is the same as in the first data part, i.e. address and following array of data bytes.

#### Characters with special use:

[] - labels must be defined inside square brackets

',' – character which delimiters basic part and optional part of data

';' - the semicolon character means the beginning of a comment. All characters from ";, to the end of line are ignored. Comment can be on individual line or in the end of definition line. **Note:** 

- Label names can contain all characters except '[' and ']'. The label names are analyzed as non case sensitive, i.e. character 'a' is same as 'A', 'b' is same as 'B' etc..
- All address and byte number values in input file are hexadecimal.
- Allowed address value size is from 1 to 4 bytes.

- Allowed size of data arrays in one line is in range from 1 to 64 bytes. When there are two data arrays in one line, the sum of their size in bytes can be maximally 80 bytes.
- Be careful to set correct addresses. Address must be defined inside device start and device end address range. In case of address out of range, warning window appears and serialization is set to disabled (None).
- Address for Serialization is always assigned to actual device organization and buffer organization that control program is using for current device. If the buffer organization is byte org. (x8), the Serialization Address will be byte address. If the buffer organization is wider than byte, e.g. 16 bit words (x16), the Serialization Address will be word address.

#### Example of typical input file for Classic From file serialization:

[nav1] A7890 78 89 56 02 AB CD ; comment1 [nav2] A7890 02 02 04 06 08 0A [nav3] A7890 08 09 0A 0B A0 C0 ; comment2 [nav4] A7890 68 87 50 02 0B 8D [nav5] A7890 A8 88 59 02 AB 7D

;next line contains also second definition [nav6] A7890 18 29 36 42 5B 6D , FFFF6 44 11 22 33 99 88 77 66 55 16

; this is last line - end of file

In the example file six serial values with labels "nav1", "nav2", ..."nav6" are defined. Each value is written to buffer on address \$A7890. All values have size 6 bytes. The line with "nav6" label has also second value definition, which is written to buffer on address \$FFFF6 and has size 10 bytes, i.e. the last byte of this value will be written to address \$FFFFF.

**Note:** Address for Serialization is always assigned to actual device organization and buffer organization that control program is using for current device. If the buffer organization is byte org. (x8), the Serialization Address will be byte address. If the buffer organization is wider than byte, e.g. 16 bit words (x16), the Serialization Address will be word address.

#### Device / Device options / Serialization / Playlist From file mode

When you use a *Playlist From-file mode* the serialization file has not serial values directly included. The file contains name list of external files that contain serialization data. Serialization data are then read from these external data files, each file means one serialization step (one device programmed). Playlist From-file mode is indicated in main window and info window of Pg4uw control program on panel "Serialization" as "From-file-pl" serialization.

#### File format

From-file serialization playlist file includes list of filenames which contain serialization data. The file format is similar to classic serialization file format. Following file format differences are for playlist files:

1. the playlist file must have special header at the first no empty line of file. The header is text line in format

FILETYPE=Pg4uw SERIALIZATION PLAYLIST FILE

2. each serial data batch is represented by separate line in format *[label x]* datafilename

#### labelx - represents label

Labels are identifiers for each no-empty line of input file. They are used for addressing each line of file. The labels should be unique within the file. Addressing lines of file means, that the required start label entered by user defines line in input file from which serial values reading starts.

datafilename - defines name of data file, which contains serialization data. When serialization requires new serial value, the data file will be loaded by standard Pg4uw "Load file" procedure to Pg4uw buffer. File format can be binary or Hex file (Intel Hex etc.). The auto-recognition system recognizes proper file format and forces load of file in the right file format. Data filename is relative to parent (playlist) serialization file.

#### Example of playlist serialization file:

;---- following file header is required ------FILETYPE=Pg4uw SERIALIZATION PLAYLIST FILE

;----- references to serialization data files [nav1] file1.dat [nav2] file2.dat [nav3] file3.dat

[label n] filex.dat ;------ end of file

For more detailed and fully functional example of serialization type From-file playlist, look the example files placed in the Pg4uw installation directory in Examples\ subdirectory as following:

<Pg4uw\_inst\_dir>\Examples\Serialization\fromfile\_playlist\_example\

The typical path can look like this:

C:\Program Files\Elnec\_sw\Programmer\Examples\Serialization\fromfile\_playlist\_example\

You can test the serialization by following steps:

1. start Pg4uw

2. you need to have our programmer connected and correctly found in Pg4uw

3. select wished device, the best are devices with erasable memory, (not OTP memory)

4. select dialog from menu Device | Device Options | Serialization

5. Set the From-file mode and in the panel From-file mode options select our example serialization file from file\_playlist.ser

6. click the OK button to accept the new serialization settings

8. run "Program" device operation

You can see at the serialization indicating labels in the main window of Pg4uw and also in info progress window during device programming and repeating of programming.

#### Additional operation with used files

This group box contains three types of operation. User can select one of the operation to do with used serialization data files in Playlist From-file mode. Following operation are available:

• option Do nothing

program does not make any operation with used serialization data files

- option Move used file to specified directory program moves used serialization data files to user specified directory of used serialization files
- option Delete used file program deletes used serialization data files

#### Directory

This option is available in playlist From-file serialization mode and selected option "Move used file to specified directory". User can specify target directory, into which used serialization data files will be moved.

Following error indicators are used in Playlist From-file serialization:

- s/n error #3 serialization data file does not exist
- s/n error #34 used serialization data file can not be deleted (maybe serialization files are placed on write-protected disk)
- s/n error #35 used serialization data file can not be moved to target directory of used serialization files (maybe serialization files are placed on write-protected disk, or target directory does not exist)

#### Device / Device options / Serialization / Custom generator mode

Custom generator serialization mode provide maximum flexible serialization mode, because the user have serialization system fully in his hands.

When Custom generator mode of serialization is selected, serial numbers are generated by user made program "on-the-fly" before each device is programmed in Pg4uw or Pg4uwMC. Custom generator mode serialization allows user to generate unique sequence of serial numbers desired. Serial numbers can be incremented as a linear sequence or completely non-linear sequence. The user made serial number generator program details are described later in the following section **Custom generator program**.

#### Examples:

There are also example .exe and C/C++ source files available. The files are placed in the Pg4uw installation directory in Examples\ subdirectory as following:

<Pg4uw\_inst\_dir>\Examples\Serialization\customgenerator\_example\

The typical path can look like this:

C:\Program

Files\Elnec\_sw\Programmer\Examples\Serialization\customgenerator\_example\

There are following options for **Custom generator serialization** in Pg4uw control software: In dialog Serialization select in **Mode** panel option Custom generator mode. The following options will be displayed:

#### Serialization data file

Specifies the path and name for the data file that will contain the current serial number. When device is to be programmed, the Pg4uw software calls user made serial number generator that updates the data file. The recommended extension of data file is .dat.

Because many of our customers use also BP Microsystems programmers, they ask us for possibility to be used the same serialization software. Therefore the Serialization data file is compatible with dat files of "Complex serialization" system, available in BP Micro software,

**Note:** The data file is completely and periodically overwritten during device programming with serialization. Be sure to enter the correct name of wished .dat file. Example: "c:\serial\_files\serial.dat"

#### Serialization generator

Specifies the path and name for the executable file which will generate serialization data file.

#### First serial number

This option is required to specify the initial serial number that will be passed to custom generator serialization program. The number is entered and displayed in hexadecimal format.

#### Last serial number

This option specifies the maximum value of serial number allowed. If the value is non-zero, it will be passed to serialization generator program. The generator is responsible for testing the value of last serial number and generate serial .dat file with appropriate error information in the serialization .dat file in case of current serial number greater then last serial number. If the value of Last serial number is zero, the value will not be passed to generator program.

#### Check box Call generator with -RESULT parameter after device operation completed

This new option has special purpose. If there is requirement to call custom generator with special parameter -RESULT, the check box should be checked. Otherwise it has to be unchecked (the default state is unchecked). If checked, custom generator is called by Pg4uw control program after each device operation is completed, no matter the result of device operation is OK or Error. Parameters for generator are created by Pg4uw serialization engine. Two parameters are used:

#### -RESULT[n]=TRUE | FALSE

where n is optional Programmer Site order number, if multiprogramming is used. TRUE means that device operation was finished OK. FALSE means, that device operation was finished with error.

#### -N<serial number>

specifies current serial number in the same way, as for normal calling of serialization generator.

#### Custom generator program

Custom generator program or serialization generator is program that will generate the unique sequence of serial numbers and write the serial data to serialization .dat file. This program is made by user. The path and name of the serialization program must be specified in the Serialization options dialog in Custom generator mode options.

The program will be called from Pg4uw every time the new serial data have to be generated. This is usually made before each device programming operation. Pg4uw control program passes command line parameters to serialization program and serialization program generates serialization .dat file which is read by Pg4uw control program. Following command line parameters are used:

-N<serial number> Specifies current serial number.

-E<serial number> Specifies ending (or last) serial number. The parameter is only passed when value of Last serial number specified in dialog Serialization in Pg4uw software is no zero. The serialization program should return error record T06 in the serialization .dat file, if the current serial number is greater than ending serial number. For details look at section Serialization .dat file format.

#### Serialization .dat file format

Serialization .dat file generated by serialization generator must meet following text format. Serialization .dat file consists of records and serial data section.

Record is line, which begin with one of Txx prefixes as described bellow. Value of "xx" represents the record type code. Records are used to inform Pg4uw software about serialization status (current and last serial numbers, serialization data and data format, errors, etc.). Required records are records T01, T02, T03 and T04. Other records are optional.

T01: <serial number=""></serial>	Contains current serial number value passed to generator by command line parameter -N <serial number="">.</serial>
T02: <serial number=""></serial>	Contains next serial number value, that Pg4uw will use in next serialization cycle. This value is generated by serialization generator and informs Pg4uw, which serial number will follow after current serial number.
T03: <data code="" format=""></data>	Specifies the serialization data format. Following formats are supported now: T03:50 or T03:55 ASCII Space data format T03:99 - Intel Hex data format
T04:	indicates the serialization data will follow from next line to the end of file. Serialization data are stored in one of standard ASCII data file formats, for example Intel Hex, ASCII Space and so on. The format used for data must be specified by record T03.

**Example:** Typical serialization data file:

T01:000005 T02:001006 T03:99 T04: :0300000000096B89 :0300030000005F5 :02000C005A0197 :01003F004F71 :0000001FF

The file consists of following information: line T01 - current serial number 000005h line T02 - ending (last) serial number 001006h line T03 - serialization data format after line T04 is Intel Hex line T04 - serialization data, which will be loaded to buffer of Pg4uw before programming device, data are represented in Intel Hex format

#### Optional records are:

*T05:<message>* Warning or error message. This record causes the serialization is stopped and warning or error message is displayed in Pg4uw software.

706: Current serial number greater than limit This record causes the serialization is stopped and warning or error message is displayed in Pg4uw software. The reason of turning serialization off is the current serial number is greater then allowed maximum ending serial number. This record can be used when -E command line parameter is specified, it means no zero Last serial value in dialog Serialization is specified. The serialization will not be

T11:<message> Less important warning or message. The serialization will not be interrupted.

Flowchart of device programming with custom-generator serialization

When Custom-generator serialization is used, it means, that before each device programming is started, serialization engine calls serialization generator executable, to generate serial .dat file. Pg4uw serialization engine manages proper command line parameters for calling of serialization generator. The data from .dat file are immediately read to internal programmer buffer and used as data for programming device. Also next serial number information (record T02) is remembered in Pg4uw.

#### Typical flowchart of device programming is following:

- 1. Start of programming batch
- 2. Device insertion test
- 3. Serialization sequence, consists from four steps:
  - call of serialization generator with proper command line parameters to generate serialization dat file
  - waiting for serialization .dat file to be available
  - reading of serialization .dat file data to programmer buffer (the data will be used for programming device)
  - delete serialization .dat file after reading of data from it
- 4. Device programming
- 5. Device verification
- 6. Operation result check.

This is fully managed by Pg4uw control program. Serialization generator does not have to do any operation according to operation result. Control program will call serialization generator with required command line parameters.

OK - Pg4uw makes request for next serial number. Next serial number was read from .dat file in step 3. Call of serialization generator will have next serial number specified in command line.

*ERROR* - Pg4uw does not make request for new serial number. Recent serial number will be used for next device. Next call of serialization generator will have recent serial number specified in command line.

- 7. Repeat programming with next device?
  - Yes goto step 2.
  - No continue at step 8.
- 8. End of programming batch

#### Notes:

In case of error programming result, recent serial number is used, but generator will be called at step 3. anyway, even if the same number is used as for previously programmed device.

If error of serialization .dat file is detected, program Pg4uw reports serialization error and stops continuing of programming batch immediately.

#### Device / Device options / Statistics

Statistics gives the information about actual count of device operations, which were proceeded on selected type device. If one device is corresponding to one device operation, e.g. programming, the number of device operations will be equal to number of programmed devices.

The next function of statistics is **Count down**. Count down allows checking the number of device operations, and then number of devices, on which device operations have to be done. After each successful device operation the value of count down counter is decremented. Count down has user defined start number of devices to do. When count down value reach zero, it means, specified number of devices is complete and user message about complete count down will be displayed.

Statistics dialog contains following options:

Check boxes **Program**, **Verify**, **Blank**, **Erase** and **Read** define operations, after which statistics values increment.

Any selected and performed device operation will increment the **Total** counter and one of **Success** or **Failure** counters depending on device operation result (success or failure). A combination of partial operations is counted as one operation only. For example, a Read operation including Verify after Read is one operation. A Program operation including Erase and/or Verify operations is counted as one operation.

Check box **Count down** sets Count down activity (enable or disable). Edit box following the Count down check box defines initial number of count down counter, from which count down starts.

Statistics dialog can be also opened by pressing right mouse button on Statistics panel and clicking displayed item Statistics.

Actual statistics values are displaying in main window of control program in Statistics panel.

Statistics panel contains three statistics values – Success, Failure, Total and two Count down information values Count down and Remains.

Meaning of the values is:

Success	number of operations which where successfully completed
Failure	number of operations which where not successfully completed
Total	number of all operations
Count down	informs about Count down activity (Enabled or Disabled)
Remains	informs about remaining number of device operations to do

**Note:** When new device type is selected, all statistics values are set to zero and **Count down** is set to **Disabled**.

Reset button in Statistics panel reset statistics values.

Reload Count down button in Statistics panel reloads initial value to Count down.

For Pg4uw software, the statistics information is saved to Log window when closing Pg4uw.

For multiprogramming Pg4uwMC software, the statistics information is saved to Job Summary report.

### Device / Device options / Associated file

This command is used for setting associated file with current device. This is a file, which can be automatic loaded to buffer after device is selected from default devices select list or by start control program.

You can edit the associated file name in file name box, put a full pathname. The control program checks the present of this file on the disk. Also is possible enabling or disabling automatic load of this file.

You can save both settings i.e. associated file and enabling of automatic load of this file to disk by command **File** / **Exit and save**.

#### Device / Device options / Special options

The special terms used here are exactly the terms used by manufacturer of respective chip. Please read the documentation to the chip you want to program for explanation of all used terms.

If the name of this menu item is starting by "View/Edit ...", then the Read device command will read the content of the chip configuration and it can be viewed and edited by this menu command.

### Device / Blank check

This command allows to blank check of all devices or its part if possible. The control program reports a result of this action by a write of a warning message to INFO window.

The menu command **Device / Device options / Operation options** allows to set another working area as the standard.

### Device / Read

This command allows to read all device or its part into the buffer. The read procedure can also read the content of the chip configuration (if it exists and is readable). The special device configuration areas can be viewed or edited in dialogs available by menu **View / Edit buffer** and menu **Device / Device options / Special options** (Alt+S).

The control program reports a finish of Read action by writing a message to INFO window.

The menu command **Device / Device options / Operation options** allows to set another working area as the standard. Setting an option Verify data after reading in this menu command means a higher reliability for device reading.

### Device / Verify

This command compares the programmed data of the all device or its part with data in buffer. The control program reports a result of verify operation to Info window and Log window.

The menu command **Device / Device options / Operation options** allows to set another working area as the standard.

Setting in dialog **General options** (menu **Options / General options**) in tab **Errors** allows to control, how to write the found errors to user specified report file. Also first 45 found errors are written to Log window.

#### Note:

- Verify operation compares content of the whole chip with the data in the software, therefore it might happen - in case of incomplete programmed chip - the verification after programming shows none error, but solo verify operation does not pass.
- Verify operation can report errors also in case of protected devices, that have active read protection of data.

### Device / Program

This command allows to programming of the all device or its part by the data of the buffer. The control program reports a result of this action by a write of an error message to INFO window.

The menu command **Device / Device options / Operation options** allows to set another working area as the standard, and set other operation options for programming process control.

### Device / Erase

This command allows erasing the whole programmable device. The program reports the end without error or end with the error by writes the warning report on the display.

The Blank check procedure is applied after Chip erase command for such chips, where doesn't exist other way how to check, the chip is really erased.

### Device / Test

This command executes a test with device selected from list of supported devices (e.g. static RAM) on programmers, which support this test.

### Device / IC test

This command activates a test section for ICs separated by type to any libraries (on distribution CD). First select an appropriate library, wished device and then a mode for test vectors run (LOOP, SINGLE STEP). Control sequence and test results are displayed to LOG WINDOW. In case of need is possible to define the test vectors directly by user. Detailed description syntax and methods of creation testing vectors is described in example\_e.lib file, which is in programs installation folder. Note. Because the rising/falling edges of programmers are tuned for programming of chips, it may happen the test of some chips fails, although the chips aren't defective (counters for example).

### Device / JAM/VME/...Player

**Jam STAPL** was created by Altera® engineers and is supported by a consortium of programmable logic device (PLD) manufacturers, programming equipment makers, and test equipment manufacturers.

The Jam<sup>™</sup> Standard Test and Programming Language (STAPL), JEDEC standard JESD-71, is a standard file format for ISP (In-System Programming) purposes. Jam STAPL is a freely

licensable open standard. It supports programming or configuration of programmable devices and testing of electronic systems, using the IEEE 1149.1 Joint Test Action Group (JTAG) interface. Device can be programmed or verified, but Jam STAPL does not generally allow other functions such as reading a device.

The Jam STAPL programming solution consists of two components: Jam Composer and Jam Player.

The Jam Composer is a program, generally written by a programmable logic vendor, that generates a Jam file (.jam) containing the user data and programming algorithm required to program a design into a device.

The Jam Player is a program that reads the Jam file and applies vectors for programming and testing of devices in a JTAG chain.

The devices can be programmed in ZIF socket or in target system through ISP connector. It is indicated by [PLCC44](Jam) or (ISP-Jam) suffix after name of selected device in control program. Multiple devices are possible to program and test via JTAG chain: JTAG chain (ISP-Jam)

More information on the website: http://www.altera.com

See please application notes:

"AN 425: Using the Jam Player to Program Altera Devices",

"AN 100: In-System Programmability Guidelines",

"AN 122: Using Jam STAPL for ISP & ICR via an Embedded Processor"

and related application notes for details.

#### Software tools:

Altera: MAX+plus II, Quartus II, SVF2Jam utility (converts a serial vector file to a Jam file), LAT2Jam utility (converts an ispLSI3256A JEDEC file to a Jam file);

Xilinx: Xilinx ISE Webpack or Foundation software (generates STAPL file or SVF file for use by utility SVF2Jam);

Jam Player version 2 (see Action and Procedures controls)

#### Action

Select desired action for executing.

Jam file of version 2 consists of actions. Action consists of calling of procedures which are executed.

Jam file of version 1 does not know statements 'action' and 'procedure', therefore choice Action is not accessible. Program flow starts to run instructions according to boolean variables with prefix DO\_something. If you need some new boolean variables with prefix DO\_something then contact us.

#### Procedures

Program flow executes statements from each procedure. Procedures may be optional and recommended. Recommended procedures are marked implicitly. You can enable or disable procedures according to your needs. Jam Player executes only marked procedures. Other procedures are ignored. Number of procedures is different, it depends on Jam file.

#### Variables

Jam file of version 1 does not know statements 'action' and 'procedure'. Program flow starts to run instructions according to boolean variables with prefix DO\_something. Jam Player executes all marked DO\_something cases in algorithm. Number of variables (procedures) is constant, it does not depend on Jam file. If you need some new boolean variables with prefix DO\_something then contact us.

#### ок

Accept selected action with appropriate procedures which are marked.

#### Information

It displays information about Jam file. You can preview Notes and source file in dialog.

#### Device according to Jam file

File is made for a specific device. Device name is found in Jam file in part NOTE identifier DEVICE. Device name must be identical with name of the device selected in dialog Select

device. When devices are different, software will indicate this situation by warning message during start of the Jam Player.

**Notes**: statements are used to store information about the Jam file. The information stored in NOTE fields may include any type of documentation or attributes related to the particular Jam program.

**Source file** contains a program in Jam language. Jam program consists of a sequence of statements. Jam statement consists of a label, which is optional, an instruction, and arguments, and terminates with a semicolon (;). Arguments may be literal constants, variables, or expressions resulting in the desired data type (i.e., Boolean or integer). Each statement usually occupies one line of the Jam program, but this is not required. Line breaks are not significant to the Jam language syntax, except for terminating comments. An apostrophe character (') can be used to signify a comment, which is ignored by the interpreter. The language does not specify any limits for line length, statement length, or program size. More information can be found on the website: <a href="http://www.altera.com">http://www.altera.com</a>

Jam file with extension .jbc is Jam STAPL Byte code format which is not visible.

#### Converting JED file to Jam STAPL file for XILINX devices:

- install Xilinx Integrated Software Environment (ISE) 6.3i software free download: WebPACK\_63\_fcfull\_i.exe + 6\_3\_02i\_pc.exe (315MB or so)
- run Xilinx ISE 6/Accessories/iMPACT
- in dialog "Operation Mod Selection: What do you want to do first?" choose: "Prepare Configuration Files",
- in dialog "Prepare Configuration Files: I want create a:" choose: "Boundary-Scan File",
- in dialog "Prepare Boundary-Scan File: I want create a:" choose: "STAPL File",
- in dialog "Create a New STAPL File" write name of Jam file with extension .stapl,
- in dialog "Add Device" select JED file with extension .jed,
- in the created jtag chain select device e.g.: XC2C32A (left mouse button) and select sequence operation (e.g.: Erase, Blank, Program, Verify; right mouse button),
- in menu select item "Output/Stapl file/Stop writing to Stapl file"
- run Pg4uw, select device e.g.: Xilinx XC2x32A [QFG32](Jam), load Jam file (Files of type: select STAPL File)

 choose "Device operation option Alt+O" press button "Jam configuration". Warning "Select device from menu "Select Devices" and Jam file is probably different! Continue?" choose Yes. (Xilinx sw. does not include line: NOTE "DEVICE" "XC2x32A"; in Jam file). In dialog "Jam player" select action and procedures, finish dialogs, press button "Play Jam" from toolbar and read Log window

#### The IspVM Virtual Machine

**The IspVM Virtual Machine** is a Virtual Machine that has been optimized specifically for programming devices which are compatible with the IEEE 1149.1 Standard for Boundary Scan Test. The IspVM EMBEDDED tool combines the power of Lattice's IspVM Virtual MachineTM with the industry-standard Serial Vector Format (SVF) language for Boundary Scan programming and test.

The IspVM System software generates VME files supporting both ispJTAG and non-Lattice JTAG files which are compliant to the IEEE 1149.1 standard and support SVF or IEEE 1532 formats. The VME file is a hex coded file that takes the chain information from the IspVM System window. The devices can be programmed in ZIF socket or in target system through ISP connector. It is indicated by [PLCC44](VME) or (ISP-VME) suffix after name of selected device in control program. Multiple devices are possible to program and test via JTAG chain: JTAG chain (ISP-VME).

More information on the website: <u>http://www.latticesemi.com</u>

#### Software tools:

Lattice: ispLEVER, IspVM System ISP Programming Software, PAC-Designer Software, svf2vme utility (converts a serial vector file to a VME file)

### Device / Device info

The command provides additional information about the current device - size of device, organization, programming algorithm and a list of programmers (including auxiliary modules) that supported this device. You can find here package information, part number description and full information for ISP implementation. For example: description of ISP connector pins for currently selected chip, recommended target design around in-circuit programmed chip.

The reserved key **<Ctrl+F1>** will bring out this menu from any menu and any time immediately.

## Programmer

Menu Programmer includes commands used for work with programmers.

### Programmer / Find programmer

This item selects a new type of programmer and communication parameters. This command contains following items:

**Programmer** - sets a new type of programmer for find. If a **Search all** is selected, the control program finds all supported programmers.

Establish communication - allows manual or automatic establishing communication for a new programmer.

**Speed** - sets speed, if a manual establishing communication is selected, which PC sends data into the programmer. Speed is expressed as a percent from a maximal speed.

**Port** - selects a port, which will be scanned for a requested programmer. If All port is selected, the control program scans all ports, which are available on standard addresses.

Pressing key **<Enter>** or button **OK** initiates scanning for programmer by set parameters. There is same activity as at start the control program. The command clears a list of default devices without the current device, if the new selected programmer supports this one.

This setting is saved to disk by command Options / Save options.

### Programmer / Refind programmer

This menu command is used to refind (reestablish communication with) currently selected programmer.

To select other type of programmer, programmer communication parameters and to establish communication with newly selected programmer use menu **Programmer / Find programmer**.

### Programmer / Handler

In dialog **Handler** a Handler type and Handler communication parameters can be set. Handler is an external device for special control of device operations in control program. When **None** Handler is selected, this means default state of control program, i.e. device operations are controlled directly by user otherwise control program is in special mode, when device operations are controlled automatically with co-operation with Handler.

Dialog Handler contains following items:

Selected Handlerselect wished Handler type.Search at portselect a COM port, which will be scanned for a requested Handler.

Pressing key **<Enter>** or button **OK** initiates scanning for Handler by set parameters. If selected Handler type is **None**, no Handler scanning will be processed. Current Handler settings are saved to configuration file by command **Options / Save options** or when control program is closed.

Handler is not available for sale.

### Programmer / Module options

This option is used for multiple socket programmers for defining MASTER socket and activity of each socket. **MASTER socket** group box allows user to set socket which is preferentially used for device reading operation. **Enable/Disable socket** checkbox array allows user to set enabling and disabling of each socket individually. Disabled sockets are ignored for any device operation.

### Programmer / Automatic YES!

This command is used for setting **Automatic YES!** mode. In this mode you just take off the programmed device, then put new device into ZIF socket and a last operation will be repeated automatically. Program automatically detects an insertion of a new device and runs last executed operation without pressing any key or button. An insertion of device into ZIF socket is displayed on the screen. Repeated operation executing will be cancelled by pressing key **<ESC>** during waiting for insert/remove a device to/from ZIF socket.

After an operation with a device is executed, one of the OK or ERROR (status) LEDs on the programmer will lights in dependence on the result of an operation and the BUSY LED will blinking.

If the program detects removal of a device, then status LED will switched off, but the BUSY LED will still blinking to indicate readiness of the program to repeat last operation with new device.

After the program indicates one or more pins of (new) device in the ZIF socket, the BUSY LED will goes to light continually. From this the program will wait a requested time for insert the rest pins of new device. If a requested time (Device insertion complete time) overflows and a device is not correctly inserted, the program will lights the ERROR LED to indicate this state. After new device was inserted correctly, the program will switch off all status LEDs, except BUSY, and will start an operation with new device.

This mode may be enabled or disabled by item **Automatic YES!** mode. If a new programmer is selected **Options / Find programmer**, this mode will be disabled.

The **Response time** is interval between insertion of the chip into the ZIF socket and the start of selected device operation. If longer positioning of the chip in the ZIF socket is necessary select **elongated** response time.

Programming adapter used shows name of adapter used with currently selected device.

**Pins of programmer's ZIF excluded from sensing** contains list of pins that will be ignored from testing by Automatic YES!. The reason to ignore the pins is mostly - capacitors connected to these pins.

Button **Setting Automatic YES! parameters** will run wizard that can detect permanently connected pins (pins with capacitors) and set these pins to list of pins excluded from sensing. After selecting of device, list of excluded pins contains default excluded pins for selected device adapter. If other bypass capacitors to universal programmer and/or device adapter are added by customer, there is necessary to run **Automatic YES! parameters wizard** to override default parameters and detect other pins with capacitors.

In **Device removal hold off time** is time period between you removed device from the ZIF socket and the time when software starts to check the socket for new device inserted. This interval is in seconds and must be from 1 to 120 (default value is 2 seconds).

In **Device insertion complete time** is possible to set a time within all pins of the device have to be properly inserted after a first pin(s) detected so that the program will not detects incorrectly inserted device. This interval is in seconds and must be from 1 to 120 (default value is 5 seconds).

The **Suspend on error** defines if the Automatic YES! function will be temporary disabled on error to see result of operation or will going on without suspension.

The options are set to defaults after new device is selected by Device / Select device

This setting is saved to disk by command Options / Save options.

**Note:** When using device socket adapters with some passive or active parts, for example capacitors for bypassing supply voltage, the Automatic YES! function may need to set these pins to Pins with capacitors list. This is necessary to make Automatic YES! function working properly. Otherwise Automatic YES! function will "think" the pins are still connected and it will not allow user to insert new device and start new programming.

### Programmer / Selftest

Command executes a selftest of current programmer without AP1 PMI selftest pod. We strongly recommend execute also **Programmer / Selftest plus** of programmer, because Selftest procedure without AP1 PMI selftest pod is not able to check whole programmer and to discover (if exist) some special errors.

### Programmer / Selftest plus

Command executes a selftest plus of current programmer using AP1 PMI selftest pod, which is included in standard delivery of programmer.

Recommendations how often run Selftest plus you can find at Maintenance section.

### Programmer / Self test ISP connector

Command executes a selftest of ISP connector of current programmer using AP1 ISP connector selftest pod.

**AP1 ISP connector selftest pod** is used for testing 20 pins ISP connector of programmers. **AP1 ISP connector selftest pod** is available as standard accessory for BeeHive204AP and BeeProg2AP. The order number: 71-2007.

Sequence for testing 20 pins ISP connector:

- 1. Insert AP1 ISP connector selftest pod into PMI connectors of the programmer.
- Interconnect 20 pins connector of AP1 ISP connector selftest pod with an ISP connector of the programmer with an ISP cable, included in delivery programmer package. Be sure that pins are interconnected properly (i.e. 1-1, 2-2, ..., 20-20).
- 3. Run selftest of ISP connector in Pg4uw (Programmer / Selftest ISP connector...).

We recommend run this test every 6 months.

### Programmer / Calibration test

Command executes test of programmer's calibration values using **AP1 Calibration test pod**, which is standard accessories for BeeHive204AP and optional accessories BeeProg2AP. The order number: 71-2008.

There are tested voltage levels of TTL drivers, VCCP, VPP1 and VPP2 voltages on each pin of PMI. Result of the Calibration Test can be saved into file and/or printed (for next use).

### Programmer / Common notes

#### Serial numbering

Table bellow is showing differences between old and new serial numbering of programmers:

new numbering	old numbering
050-00xxx	050-xxx
050-01xxx	950-xxx
050-02xxx	850-xxx
050-03xxx	750-xxx

# Options

The Options menu contains commands that let you view and change various default settings.

### **Options / General options**

General options dialog allows user to control and set variety of Pg4uw program options. The options can be saved to Pg4uw configuration file when closing Pg4uw application, or anytime by command Options / Save options.

#### File options

File options page allows you to set options for erase buffer before loading, auto-reload of current file and recognition method of file formats for loaded files.

**Erase buffer before loading** option sets **erasing** buffer (with desired value) automatically before loading of data file.

In group **When current file is modified by another process** can be set mode of reloading of actually loaded (current) file. There are three choices:

- Prompt before reloading file
- Reload automatically
- · Ignore change scanning of current file

There are three situations when file modification is tested:

- switching to the control program from another application
- selecting the device operation Verify or Program
- when repeat of last device operation is selected in dialog "Repeat?"

Load file format allows to set mode of file format recognition for loading files. When automatic file format is selected, program analyses format of loading file and test file for each

of supported formats that are available in program. If file format matches one of supported formats, the file is read to buffer in detected format.

Manual file format allows user to select explicitly wished file format from list of supported file formats. File may be loaded no completely or incorrectly, if file format does not match to user selected format.

Check box **Show "Load recent project" dialog on program start** sets the dialog to appear on application Pg4uw start. Dialog **Load recent project** contains list of recent projects (project history). User can quickly select and load any of the project from list, or close the dialog without loading of project file.

#### File extensions

File extensions page allows you to set file masks.

File format masks is used for setting file-name masks to use as a filter for file listing in File / Save and File / Load file window for all file formats. Mask must contain one of wildcards (\*, ?) at least and must be applied correctly by syntax.

**Note:** More masks can be specified for each file format. Semicolon is used as delimiter for extensions.

Example:	Motorola:	*.MOT;*.S19		
	Defines two file masks	*.MOT and *.S19 - for Motorola file format.		

**Project file default extension** is used for setting project files-extension used as default extension in **File / Load** project and **File / Save** project dialogs.

#### Buffer

This page allows you to select **Erase buffer before selecting of new device** action. This can be useful for some kind of special devices, which require exact type of data at certain addresses, and the data are not part of data file loaded to buffer for this device.

Buffer can be erased (filled) with default "blank" value for selected device or with customdefined value. This can be controlled by selection group box **Erase value** and **Custom erase value** edit field.

**Notes:** We do not recommend to use this function for large devices (more than 8 MB) because it can consume more time to make buffer erase. The setting is saved to Pg4uw configuration file. It is not saved to project file.

#### Language

This page allows you to select another language for user interface such as menu, buttons, dialogs, information and messages. It also allows to select wished help file in another language. For another language support of user interface the language definition file is required.

#### Sound

Panel **Sound settings** page allows user to select the sound mode of program. Program generates sounds after some activities, e.g. activities on device (programming, verifying, reading, etc.). Program generates sound also when warning or error message is displayed. User can now select sound from Windows system sound (required installed sound card), PC speaker or none sound.

Panel Allow sound for following actions contains following options:

#### Check box Successful operation

When checked, sound will be generated after device operation successfully completed. When unchecked, no sound will be generated after successful device operation.

Check box In case of error

When checked, sound will be generated after device operation is finished with error. When unchecked, no sound will be generated after device operation finished with error.

In the panel **Programmer internal speaker sound settings** is possible to set sound options for some programmers with built-in internal speaker. Sound beeps are then generated from internal programmer speaker after each device operation for indicating device operation result – good or bad result.

#### Errors

This option allows to set a device verify errors saving to file. When verify errors occur, first 45 differences are written to Log window. If user wants to save the verify errors (data differences) to file, he can set options in section **Save device verify errors to file** to one of two methods: cumulate errors from all verify actions to the same file or save errors to file just from last verify action. Verify errors will be saved to file with name specified by **Error file name** edit box. Following error report file options are available:

- option No (default) verify errors saving to file is disabled. Errors are displayed just on screen
- option **New** save verify errors to file just from last verify action. Before first write of new verify action is file deleted and created as new one
- option **Append** verify errors from all verify actions are cumulated into the same file. If file does not exist, the new file will be created

Box **Error report file size limit** contains settings that allow to set max. number of verify errors saved to file. It contains following options:

- Check box Stop verification after max. number of errors reached If checked, verify action will finish after Max. number of errors will be written in file. If not checked, all verify errors are saved to the file.
- Edit box **Max. number of errors** specifies number of verify errors, that can be written to error file in one verify operation.

#### Log file

This options associates with using of **Log window**. All reports for Log window can be written into the Log file too. The Log file name is "Report.rep" as default. The control program creates this file with name and directory specified in **Log file name** edit box. Following Log file options are available:

- No default, content of Log window is not copied to Log file, i.e. all reports will be displayed to Log window only
- New deletes old Log file and creates new one during each start of control program
- Append adds Log window reports into existing Log file, If file does not exist, the new file will be created

Checkbox Add date information to Log file name allows user to set date information into Log file name specified by user in Log file name edit box. When the checkbox is checked, program automatically adds current date string into user specified Log file name by the following rules:

If user specified log file name has format: <user\_log\_file\_name>.<log\_file\_extension>

The name with added date will be: <user\_log\_file\_name><-yyyy-mmm-dd>.<log\_file\_extension>

The new part representing of date consists of yyyy - year, mmm - month and dd - day.

#### **Example:** User specifies Log file name: c:\logs\myfile.log

The final log file name with added date will look like this (have a date November, 7th, 2006): c:\logs\myfile-2006-nov-07.log

If do you wish to have log file name without any prefix before date information, you can specify the log file name as:

.<log\_file\_extension> - dot is the first in file name

#### Example: User specifies Log file name: c:\logs\.log

The final log file name with added date will look like this (have a date November, 7th, 2006): c:\logs\2006-nov-07.log

Advanced options about Log file size limit are available too.

- option Use Log file text truncating when file size limit is reached when checked, the Log file size limit is on. It means, that when Log file size reaches specified value, the part of text included in Log file will be truncated. When the option is unchecked, the size of Log file is unlimited, respectively is limited by free disk space only.
- option Maximum Log file size specifies the maximum size of Log file in kB.
- option Amount of truncated text specifies the percentage of Log file text, which will be truncated after Maximum Log file size is reached. The higher value means more text will be truncated (removed) from Log file.

The Log file settings can be saved to disk by command Options / Save options.

#### Job Report

Job Report represents the summary description of operation recently made on device. Job is associated with project file and it means the operation starting with Load project until loading of new project or closing program Pg4uw.

Job Report contains following information:

- project name
- project date
- Protected mode status
- Pg4uw software version
- programmer type and serial number
- start time of executing the Job (it means time when Load project operation was performed)
- end time of executing the Job (time of creating the Job Report)
- device name
- device type
- checksum
- device operation options

- serialization information
- statistics information

Job Report is generated in following cases:

- user command Load project is selected
- closing or disconnecting programmer sites is selected
- closing the Pg4uw
- device Count down counter reaches 0 (finished status)
- manually by user, when menu "File | Job Report" is used

The Job Report is generated for recently loaded project file, only when statistics value of Total is greater than 0.

It means, at least one device operation (program, verify,...) must be performed.

Following options are available for Job Report:

Checkbox **Enable Job Report function** - when checked, the Job Report function is active (enabled). Otherwise the Job Report function is disabled.

Checkbox Automatically save Job Report file - when checked, the Job Report will be saved automatically to directory specified in edit field Job Report directory and with file name created as following:

```
job_report_<ordnum>_<prjname>.jrp
```

where

<ordnum> is decimal order of the file. If there exist any report files with the same name, then order for new report file is incremented about order of existing files.

<priprime> is project file name of recently used project, and without the project file name extension.

#### Example 1:

Let's use the project file c:\myproject.eprj and directory for Job Report set to d:\job\_reports\. There are no report files present in the Job Report directory.

The final Job Report file name will be: d:\job\_reports\job\_report\_000\_myproject.jrp

#### Example 2:

Let's use the conditions from Example 1, but assume there is already one report file present. Name of this file is d:\job\_reports\job\_report\_000\_myproject.jrp

The final Job Report file name of new report will be: d:\job\_reports\job\_report\_001\_myproject.jrp

Note, the order inside file name is incremented by 1.

When **Automatically save Job Report file** setting is set, no Job Report dialogs appears when generating Job Report. Newly generated Job Report is saved to file without any dialogs or messages (if no error occurs while saving to file).

If the checkbox **Automatically save Job Report file** is unchecked, the Pg4uw will show Job Report dialog every time needed.

In the Job Report dialog user can select operation to do with Job Report. If user selects no operation (Close button), the Job Report will be written to Pg4uw Log Window only. Example of typical Job Report dialog is shown bellow:

#### Remote control

Remote control of Pg4uw control program allows to control some functions of Pg4uw application by other application. This is very suitable feature for integrating device programmer to mass-production handler system or other useful application.

Remote application that controls Pg4uw acts as Server. Program Pg4uw acts as Client. Communication between Pg4uw and remote control program is made via TCP protocol - this allows the Pg4uw to be installed on one computer and remote control application to be installed on another computer, and these computers will be connected together via network.

Default TCP communication settings for remote control are:

#### Port: telnet Address: 127.0.0.1 or localhost

Address setting applies for Pg4uw (Client) only. Port setting applies for Pg4uw (Client) and also for Server application.

Default settings allow to use remote control on one computer (address localhost). Pg4uw (Client) and remote control Server have to be installed on the same computer.

**Note:** If firewall is installed on system, firewall can display warning message when remote control Server or Client is starting. When firewall is showing warning with question asking to allow or deny network access for remote Server or Client, please select 'Allow' option, otherwise remote control will not work. Of course you can specify in firewall options more strict rights to allow remote Server/Client access on specified address and port only.

For more information about remote control of Pg4uw and demonstration remote control applications, please see the application note **remotemanual.pdf** placed in subdirectory \RemoteCtrl which is in the directory, where Pg4uw is installed. Manual for remote control is available also from Windows Start / Programs menu link to Remote manual, created during Pg4uw installation.

#### Note:

Remote control for multiprogramming can be done only by remote control of the Pg4uwMC control software.

#### Save options

Page allows you to select the program options saving when exiting program. Three options are available here:

Don't savedon't save options during quitting program and don't ask for saving optionsAuto savesave options during quitting program without asking for saving optionsPrompt for saveprogram asks user for saving options before quitting program. User can select to save or not to save options

#### Other

Page **Other** allows user to manage other program settings.

Panel **Application priority** allows user to set the priority of the program. Priority settings can affect performance of programmer (device programming time), especially if there are running more demanding applications in the system. Please note that setting application priority level to Low can significantly slow down the program.

In the panel **Tool buttons**, hint display options on toolbar buttons in main program window can be modified. In the panel **Start-up directory** can be selected mode of selecting directory when program starts. **Default start-up directory** means directory, from which program is called. **Directory in which program was lastly ended** means the last current directory when program was lastly ended. This directory assumes the first directory from directory history list.

### **Options / View**

Use the View menu commands to display or hide different elements of program environment such as toolbars.

Following toolbars are available now:

### Options / View / Main toolbar

Choose this command to show or hide the Main toolbar.

#### **Options / View / Additional toolbar**

Choose this command to show or hide the Additional toolbar.

#### **Options / View / Device options before device operation**

Choose this command to enable/disable display of Device options before device operation is confirmed.

### **Options / Protected mode**

**Protected mode** is special mode of program. When program is in Protected mode, there are disabled certain program operation and commands that can modify buffer or device settings. Protected mode is used for prevent operator from modify buffer or device settings due to insignificance. Protected mode is suitable for the programming of a large amount of the same type of devices.

Protected mode function is available independently in single programming control software Pg4uw and in multiprogramming control software **Pg4uwMC**.

#### Protected mode in Pg4uw

There are two ways how to switch program to Protected mode:

- 1.by using menu command **Options / Protected mode**. This command displays password dialog. User has to enter password twice to confirm the password is correct. After password confirmation program switches to Protected mode. The entered password is then used to switch off Protected mode.
- 2.by reading project, that was previously saved in Protected mode. For details see File / Save project.

To switch program from Protected mode to normal mode, use the menu command **Options** *I* **Normal mode**. The "**Password required**" dialog appears. User has to enter the same password as the password entered during switch to Protected mode.

Other way to cancel Protected mode of program is closing of program, because program Protected mode is active until program is closed. The next program start will be to Normal (standard) mode (the only exception is case of project loaded by command line parameter name of project and the project was saved in Protected mode).

#### Protected mode in Pg4uwMC

Program Pg4uwMC has Protected mode very similar to program Pg4uw. The difference is, that Protected mode can be activated by menu command but cannot be activated by Project file. Another difference is, that Protected mode settings of Pg4uwMC are saved to configuration .ini file of Pg4uwMC while program Pg4uwMC is closed. During next start of application Pg4uwMC the recent Protected mode settings obtained from .ini file are used.

There is one menu command - **Options / Protected mode** - that allows to use Protected mode in application Pg4uwMC. After selecting the menu Options / Protected mode, password dialog appears. User has to enter password twice to confirm the password is correct. After successful password confirmation program switches to Protected mode.

Protected mode settings are saved to configuration .ini file of Pg4uwMC. During next start of program Pg4uwMC the Protected mode settings from .ini file are used.

There is also available one special option - **Keep "Load project" operation allowed**. The option is set to disable at default - it means the Load project operation button and menu will be disabled when Protected mode is active.

If the option is enabled (checked), the Load project operation button and menu will be allowed in Protected mode.

To switch program from Protected mode back to Normal mode, use the menu command **Options / Normal mode**. The **"Password required"** dialog appears. User has to enter the same password as the password entered during switch to Protected mode.

When Protected mode is active, the label "Protected mode" is visible near the top of Log window of Pg4uwMC main window.

**Note:** Sometimes when Protected mode is switched from active state to inactive state (Normal mode), some commands (for example command "Load project") may remain disabled. This can be resolved by clicking on button **Stop ALL**.

#### Multi-projects

Multi-project is special feature designed to simplify the programming tasks for multichip devices.

**Multichip device** is device with two or more independent chips (of the same or various types) in single package.

**Sub-device** - an individual part of multichip device. Sub-device is selectable from Pg4uw device list. Once selected, you can work with respective chip in fully manner. You can define, test and save the project file for the partial chip.

**Master device** - a multichip device unit, consists of sub-devices. Master-device is selectable from Pg4uw device list, too. Once selected, you can use Multi-project Wizard to build-up the Multi-project file from individual project files and save/load/execute it.

**Multi-project file** is special file that contains user selected project files. Multi-project file can include one or more projects. Projects included in Multi-project (file) are also called sub-projects.

**Project file** - a special file, that combines buffer data, Device operation options, special options and some level of safety features. It completely defines the way how to treat with the device. Once saved, it can be reloaded anytime and the operation can be repeated exactly.

**Multi-project Wizard** - an assistant for Multi-project file building. The Wizard allows user to select projects that have to be included in Multi-project and save them to one Multi-project file. Process of saving selected project files to one Multi-project file is called Multi-project file building. The Wizard also allows to start device operation according to projects (sub-devices) included in Multi-project. More information about Multi-project Wizard is described bellow.

#### Multi-project Wizard

Multi-project device operation requires Multi-project file, which contains partial sub-projects associated to sub-devices (chips) of Master device. Multi-project file can be created in Multi-project Wizard. The Wizard has following main functions:

- Select of sub-projects and build final Multi-project file
- Load of existing Multi-project file \*1
- Start device operation of recent Multi-project

**Note \*1:** Existing Multi-project file can be loaded from main menu of Pg4uw using menu File | Load project or from Multi-project Wizard by Load multi-prj command.

#### Multi-project Wizard contains following controls:

- Button Load multi-prj Button is used for load of existing Multi-project file.
- Button Build Multi-project Button is used for build of new Multi-project file, which uses projects listed in table Subprojects.
- Table 1: Sub-projects Table contains list of projects, that are included in recent Multi-project.
- Button Add project Button is used for adding of new project file(s) to list of project files in Table 1.
- Button Remove project Button is used for removing of selected project file from list of project files in Table 1.
- Buttons Move up a Move down
  Buttons are used for moving of selected project in Table 1 one position up or down.
  Projects are processed in specified sequence order, the upper-most (#1) as first.
- Button Help Shows this help.
- Buttons of device operation Blank, Verify, Program, Erase Buttons are used for running of selected device operation on all chips (sub-devices) listed in table Sub-projects. One type of operation can be run at a time.

#### Following two basic actions have to be performed when using Multi-project:

- Making (building) of Multi-project (or Multi-project file)
- Using of Multi-project for running of device operation

#### Making (building) of Multi-project (or Multi-project file)

Following steps are recommended when making Multi-project file:

- Create "classic" projects, one project for each sub-device of multichip device. Projects are created in the same way as projects for generic devices:
  - select sub-device according to required chip of multichip device \*1
  - set device parameters, settings, and load required device data to buffer by Load file command in Pg4uw
  - optionally make test of device operation by running the device operation on device
  - if everything is OK, the project file can be created by Save project command
- Select Master multichip device, the Multi-project has to be used for. After selection of multichip device, Multi-project Wizard is automatically opened.
- In Multi-project Wizard add required projects by Add project button. Each project represents one sub-device of multichip device.
- After completing of sub-project selection, use button Build Multi-project to create final Multi-project file. Program will prompt for name of new Multi-project file. Final Multi-project file will contain all sub-projects listed in Table 1: Sub-projects.

#### Notes:

There is possible to create Multi-project from any classic project files. So association with Master device is not mandatory. It is only on user's consideration how to combine correct sub-devices (sub-projects) into one Multi-project. This feature can be especially useful when using ISP programming of devices in JTAG chain with different projects defined.

Multi-project Wizard can be opened by one of following actions:

- selecting of Master multichip device from Select Device dialog in Pg4uw
- loading of created Multi-project file
- opening dialog Multi-project Wizard directly from Pg4uw menu Options | Multi-project Wizard

*1 Convention for	r Master-device and Sub-device part names in Pg4uw device list:
Master-device:	Multichip_original_part_name [package_type]
Sub-devices:	Multichip_original_part_name [package_type] (part1)
	Multichip_original_part_name [package_type] (part2)
Example:	 Multichip_original_part_name [package_type] (part n)
Master-device:	TV0057A002CAGD [FBGA107]
Sub-devices	#1 TV0057A002CAGD [FBGA107] (NAND)
	#2 TV0057A002CAGD IFBGA1071 (NOR)

#### Using of Multi-project for running of device operation

Typical usage of existing Multi-project file has following order.

For single programming in Pg4uw:

- Load created Multi-project by File / Load project menu command in Pg4uw main window or Load multi-prj button in Multi-project Wizard.
- After successful loading of Multi-project, Multi-project Wizard is opened automatically.
- In Wizard run wished device operation using one of available device operation buttons (Blank, Verify, Program, Erase), mostly Program device operation is used. Selected device operation is executed as sequence of sub-project loading and consequent sub-

device programming for each sub-device defined in Multi-project. And this is main purpose of Multi-project - to automate running sequence of device operations for each chip of multichip device. The side effect of this concept is, that device progress indicators are reset to 0 at beginning of each sub-device operation, so it looks like progress bar is "jumping" to 0 few times while multichip operation is running.

 After programming of all sub-devices is completed (or error occurs), standard "Repeat" dialog is displayed. Programmed device can be removed from programmer socket and new device can be inserted. Pressing Yes button in dialog Repeat or YES! button on programmer \*, will start multichip device programming sequence again.

\* If Automatic YES! function is turned on, no Repeat dialog is displayed after device operation is completed, but Automatic YES! window will appear. The window shows status of programmer socket and notice about removing of programmed device and inserting of new device to programmer socket. After inserting of new device, multichip device operation sequence will start automatically. For more details about Automatic YES! function, please take a look at **Programmer / Automatic YES**!

For multiprogramming by Pg4uwMC or standalone programmer:

- Load Multi-project by Load project menu.
- Run wished device operation by one of available device operation buttons (Blank, Verify, Program, Erase), mostly Program device operation is used. Selected device operation is executed as sequence of sub-project loading and consequent sub-device programming for each sub-device defined in Multi-project. The side effect of this concept is, that device progress indicators are reset to 0 at beginning of each sub-device operation, so it looks like progress bar is "jumping" to 0 few times while multichip operation is running.
- After programming of all sub-devices is completed (or error occurs), information with result of device operation is displayed in Pg4uwMC. Programmed device can be removed from programmer socket and new device can be inserted. Pressing operation button for the Site or YES! button on programmer Site \*, will start multichip device programming sequence again.

\* If Automatic YES! function is turned on, sequence of device operation is started again automatically after removing of programmed and inserting of new device to programmer socket. For more details about Automatic YES! function, please take a look at **Programmer / Automatic YES!**.

#### Notes:

- serialization is not supported in multiprogramming mode (only single programming supports serialization)
- count-down function is not supported now

### **Options / Save options**

This command saves all settings that are currently supported for saving, even if auto-save is turned off. Following options are saved: options under the Options menu, ten last selected devices, file history, main program window position and size.

# Help

Menu **Help** contains commands that let you view supported devices and programmers and information about program version too.

Pressing the **<F1>** key accesses the Help. When you are selecting menu item and press **<F1>**, you access context-sensitive help. If Pg4uw is executing an operation with the programmer **<F1>** generates no response.

The following Help items are highlighted:

- words describing the keys referred to by the current Help
- all other significant words
- current cross-references; click on this cross-reference to obtain further information.

Since the Help system is continuously updated together with the control program, it may contain information not included in this manual.

Detailed information on individual menu commands can be found in the integrated on-line Help.

**Note:** Information provided in this manual is intended to be accurate at the moment of release, but we continuously improve all our products. Please consult manual on <u>www.elnec.com</u>.

### Help / Supported devices

This command displays list of all devices supported by at least one type of all supported programmers. It is useful especially when user wants to find any device supported by at least one type of programmers.

Prefix "g\_" before name of device means the device is supported by multi-socket programmer.

### Help / Supported programmers

This command displays information about programmers, where supported this program.

### Help / Device list (current programmer)

This command makes a list of all devices supported by current programmer and saves it to **????DEV.txt** text file and **????DEV.htm** HTML file in the directory where control program is run from. Marks **????** are replaced by abbreviated name of current programmer, the device list is generated for.

### Help / Device list (all programmers)

This command makes device lists for all programmers and saves them to **????DEV.TXT** text files and **????DEV.HTM** HTML files in the directory where control program is running from. Characters **????** are replaced by abbreviated name of programmers, the device lists are generated for.

**Note:** The control program loses all information about current device after this command is executed. Reselect wished device again by any of select methods in menu **DEVICE**.

### Help / Device list (cross reference)

This command makes cross reference list of all devices supported by all programmers available on market and supported by this control program. The resulting list is in HTML format and consists of following files:

- one main HTML file TOP\_DEV.htm with supported device manufacturers listed
- partial HTML files with list of supported devices for each device manufacturer

Main HTML file is placed to directory where this control program for programmers is located.

Partial HTML files are placed to subdirectory **DEV\_HTML** placed to the directory where control program for programmers is located.

### Programmer / Create problem report

Command Create problem report is used for writing more particular diagnostic information to **Log window** and consequently copy **Log window** content to clipboard. The Log window content can be placed from clipboard to any text editor. Problem report is useful when error occurs in control program or programmer and kind of the error is, that user can not resolve it oneself and he must contact programmer manufacturer. In this case when customer send message to manufacturer about his problem it is good to send also problem report. Problem report can help manufacture to localize the reason of error and resolve it sooner.

### About

When you choose the Info command from the menu, a window appears, showing copyright and version information.

# Pg4uwMC

Program **Pg4uwMC** is used for fully parallel concurrent device multiprogramming on more programmers or on one multiprogramming capable programmer connected to USB ports to the same computer.

**Pg4uwMC** is focused to the easy monitoring of high-volume production operations. Operatorfriendly user interface of Pg4uwMC combines many powerful functions with ease of use and provides overview of all important activities and operation results without burden of operator with non-important details.

**Pg4uwMC** is using a project file to control the multiprogramming system. Project file contains user data, chip programming setup information, chip configuration data, auto programming command sequence, etc. Therefore the operator error is minimized, because the project file is normally created and proofed by engineering and then given to the operator. The optional protected mode can be set for project file to avoid unwanted changes of the project file. Each chip may be programmed with different data such as serial number, configuration and calibration information.

Program Pg4uwMC consists of following main windows:

- main window
- · settings dialog window
- "Search for Programmers" dialog window

For more details about multiprogramming and how to use Pg4uwMC, please refer to user's manual for any of our USB interfaced concurrent multiprogramming system (programmer).

### The basic description of the main parts of Pg4uwMC

Pg4uwMC main window

Main window of Pg4uwMC consists of following parts:

#### Menu and tool buttons

Menu and tool buttons allow access to most of Pg4uwMC functions.

#### Tool button Settings

Button is used to open Pg4uwMC Settings dialog. Settings dialog is described bellow.

#### Panels Site #1, Site #2,...

Panels are used to inform about:

- Programmer Site selected
- Programmer Site activity
- · current device operation status and/or result

Each panel also contains button Run or button YES! used to start device operation.

#### **Box Statistics**

Box Statistics informs about number of programmed devices and number of good and failed devices.

#### Checksum

Checksum is showing simple checksum of data loaded from current project file.

#### **Panel Status window**

 Panel Status window informs about current state of each Site. State can be

 Blank
 Site is no active

 Ready
 Site is active and ready to work. Programmer is connected. No device operation is running.

and other information currently running device operation, result, programmer connection state and so on

#### Log window on the right side of Status window

Log window contains information about connecting/disconnecting programmers, device operation results and other information.

#### **Button Connect programmers**

Button is used to connect all selected Programmer Sites. This button is usually used as the first step after starting Pg4uwMC.

#### **Button Disconnect programmers**

Button is used to disconnect all connected Programmer Sites and close Programmer Sites control programs. The button will apply only if no device operation is currently running on any connected programmer.

#### Button Run <operation>

Button is used to start device operations on all connected programmers at the same time. The value of <operation> can be one of following types: Program, Verify, Blank check, Erase.

#### Button Stop ALL

Button is used to stop currently running device operations on all connected Programmer Sites.

#### **Button Help**

Button is used to display this help.

### Pg4uwMC Settings dialog

les #1	Serial number	Project file	 Device in project file
5ite #1	534-00001	C: (mx29r040 cest.pr)	Same ind Kacecial IDM [TSOD48]
Site #2	534-00002		 Samsung K9G8G08U0M [TSOP48]
Site #4	534-00004		Samsung K9G8G08U0M [TSOP48]
imer refresh	rate 20	00ms Defaults	Use Project settings     Always on     Never on

Pg4uwMC Settings dialog is used to set or display following options:

- table containing information / settings for Programmer Sites: Site numbers, Site serial numbers, Site associated Project files
- checkbox Use Site #1 project for all Sites
- checkbox Automatic YES!
- panel Timer refresh rate settings
- panel Log file settings

#### Table containing information / settings for Programmer Sites

On the top of Pg4uwMC Control panel is table which contains three columns:

- column Sites contains checkboxes with Site numbers #1, #2, #3, #4 used to enable/disable using individual Programmer Site with specified Site number
- column Serial number contains information about serial numbers for Programmer Sites
- column Project file contains edit lines Project: #1, Project: #2, ...Project: #4 for setting
  individual projects to be loaded after running each Pg4uw. Project file names can be
  entered manually or by dialog Select project file, which can be opened for each Site by
  clicking on button "..." placed on the right side of each project edit line. If the project name
  edit line is blank, the automatic project load will not be performed.

#### Checkbox Use Site #1 project for all Sites

Checkbox Use Site #1 project for all Sites placed under the Sites numbers and Projects table.

When there is requirement to program the same device types with the same data, the checkbox should be checked.

- If the checkbox is checked, the project file for Site #1 will be used also for all other Programmer Sites. In this mode all Sites are using the same shared buffer of project data and program the same device type.
- If the checkbox is not checked, each Site will use its own project file defined by name in table of Sites in column Project file. In this mode each Site is using its own buffer of

project data, which allows to program different data to different types of devices at the same time in each Site.

#### Checkbox Automatic YES!

Automatic YES! checkbox - when checked, Automatic YES! is set on for all programmers. For more details about Automatic YES! feature see Programmer / Automatic YES. This feature may not be available for some types of programmers.

#### Panel Timer refresh rate settings

Timer refresh rate defines how often the Pg4uwMC program will request status information from running Programmer Sites. Status information means current device operation type, progress, result and so on. Current status information is displayed in main window of Pg4uwMC. The default timer refresh rate value is 200ms. If you wish faster refresh of status information displayed in Operation panel of Pg4uwMC, shorter refresh interval. If you notice the system performance slow down, when using faster refresh, select higher refresh value to make refresh less often. On the Pentium 4 computers there is almost no performance penalty depending on timer refresh rate but on slower computers it is sometimes useful to select longer (less often) timer interval.

Panel Log file settings are used to set mode of using Log file report

Pg4uwMC Settings		
Multiprogramming Log file	Job Report Sounds	
0110101 1001010 01101010 00011000	Log file settings:       ● Append Log file         Log file:       Id Settings\peter\Application Data\Pg4uw\reportmc.log         Browse       Add date information to Log file name         Log files size limit       Use Log files text truncating when file size limit is reached         Maximum Log file size:       4000       kB (200 kB200000 kB)         Amount of truncated text:       552 v	
	🗸 OK 🛛 🗶 Cancel 👔	Help

Log file is text file containing information about Pg4uwMC control program operation flow, which means information about loading project files, device operation types and device operation results. Multiprogramming system generates few of Log files. One main Log file of program Pg4uwMC and Log files for each of running Programmer Sites. Each Site has its own one Log file. The name of Site's Log file has the same prefix as the name of Log file specified in edit box Log file. The file name prefix is followed by the number of Site in the form of #<Snum>.

#### Example:

The Log file name specified by user is: "report.log". Then names of Log files will be:

- Pg4uwMC main Log file name "report.log"
- Site's #1 Log file name "report\_#1.log"
- Site's #2 Log file name "report\_#2.log"
- Site's #3 Log file name "report\_#3.log" and so on...

Following options can be set for Log file creation

- option Append Log file sets usage of Log file on. Log file will be created after the first
  restart of Pg4uwMC. For all other next starts of Pg4uwMC, the existing Log file will be
  preserved and new data will be appended to the existing Log file.
- option Rewrite Log file sets usage of Log file on. Log file will be created after the first restart of Pg4uwMC. For all other next starts of Pg4uwMC, the existing Log file will be rewritten and new Log file will be created. Data from previous Log file will be deleted.

Checkbox Add date information to Log file name allows user to set date information into Log file name specified by user in Log file name edit box. When the checkbox is checked, program automatically adds current date string into user specified Log file name by the following rules:

If user specified log file name has format:

#### <user\_log\_file\_name>.<log\_file\_extension>

The name with added date will be:

<user\_log\_file\_name><-yyyy-mmm-dd>.<log\_file\_extension>

The new part representing of date consists of yyyy - year, mmm - month and dd - day.

Example: User specifies Log file name: c:\logs\myfile.log

The final log file name with added date will look like this (have a date November, 7th, 2006): c:\logs\myfile-2006-nov-07.log

If do you wish to have log file name without any prefix before date information, you can specify the log file name as:

.<log\_file\_extension> - dot is the first in file name

Example: User specifies Log file name: c:\logs\.log

The final log file name with added date will look like this (have a date November, 7th, 2006): c:\logs\2006-nov-07.log

#### Advanced options about Log file size limit are available too:

- option Use Log file text truncating when file size limit is reached when checked, the Log file size limit is on. It means, that when Log file size reaches specified value, the part of text included in Log file will be truncated. When the option is unchecked, the size of Log file is unlimited, respectively is limited by free disk space only.
- option Maximum Log file size specifies the maximum size of Log file in kB.
- option Amount of truncated text specifies the percentage of Log file text, which will be truncated after Maximum Log file size is reached. The higher value means more text will be truncated (removed) from Log file.

#### Common information:

**Index of Programmer Site** is integer number from 1 to 8 which defines unambiguously each running Programmer Site.

Serial number of Programmer Site defines unambiguously the programmer or programmer site used. Instance will search all programmers connected on USB Bus until it finds programmer (site) with desired serial number. Programmers or Programmer Sites with

different serial numbers will be ignored. If the Pg4uwMC does not find desired Programmer Site, the Programmer Site will be set to Demo mode with status set to "Not found".

On one computer, 8 Programmer Sites can be run at the same time.

Job Report settings are used to set mode of using Job Report.

Job Report represents the summary description of operation recently made on device. Job is associated with project file and it means the operation starting with Load project until loading of new project or closing program Pg4uwMC.

Job Report contains following information:

- project name
- project date
- Protected mode status
- Pg4uwMC software version
- programmer type and serial number
- start time of executing the Job (it means time when Load project operation was performed)
- end time of executing the Job (time of creating the Job Report)
- device name
- device type
- checksum
- device operation options
- serialization information
- statistics information

Job Report is generated in following cases:

- user command Load project is selected
- · closing or disconnecting programmer sites is selected
- closing the Pg4uwMC
- device Count down counter reaches 0 (finished status)
- manually by user, when menu "File | Job Report" is used

The Job Report is generated for recently loaded project file, only when statistics value of Total is greater than 0.

It means, at least one device operation (program, verify,...) must be performed.

Job Report dialog settings are in dialog Pg4uwMC Settings (menu Options | Settings) in tab Job Report.

Following options are available for Job Report:

Pg4uwMC Settings				×
Multiprogramming	Log file	Job Report	Sounds	
Job Report	ly save Jo rectory:	ib Report file C:\Docume	nts and Settings\peter\Application Data Browse See Job Report	
			▼ OK Xancel 21 Hel	,

When the checkbox Automatically save Job Report file is checked, the Job Report will be saved automatically to directory specified in edit field Job Report directory and with file name created as following:

job\_report\_<ordnum>\_<prjname>.jrp

where

*<ordnum>* is decimal order of the file. If there exist any report files with the same name, then order for new report file is incremented about order of existing files.

*priname*> is project file name of recently used project, and without the project file name extension.

**Example 1:** Let's use the project file c:\myproject.eprj and directory for Job Report set to d:\job\_reports\

There are no report files present in the Job Report directory.

The final Job Report file name will be:

d:\job\_reports\job\_report\_000\_myproject.jrp

**Example 2:** Let's use the conditions from Example 1, but assume there is already one report file present.

Name of this file is d:\job\_reports\job\_report\_000\_myproject.jrp

The final Job Report file name of new report will be:

d:\job\_reports\job\_report\_001\_myproject.jrp

Note, the order inside file name is incremented by 1.

When **Automatically save Job Report file** setting is set, no Job Report dialogs appears when generating Job Report. Newly generated Job Report is saved to file without any dialogs or messages (if no error occurs while saving to file).

If the checkbox **Automatically save Job Report file** is unchecked, the Pg4uwMC will show Job Report dialog every time needed.

In the Job Report dialog user can select operation to do with Job Report. If user selects no operation (Close button), the Job Report will be written to Pg4uwMC Log Window only.

Example of typical Job Report dialog is shown bellow:

🤠 Job Report: Macronix MX29F040	8
Job Start Time: 2008-10-09 13:07:00 Job End Time: 2008-10-09 13:07:07 Job Elapsed Time: 0 Hours 0 Minutes 7 Seconds	^
Device Name: Macronix MX29F040 Device Size: 80000hx8 bit Checksum: 03FCE3ABh Byte sum (x8)	
<pre>=== Device operation options ==== - Addresses Device start: 0000000000 Device end: 000007FFFF Buffer start: 0000000000 Split: None - Insertion test Insertion test Insertion test: Disable Device ID check error terminates the operation: Disable - Command execution Erase before programming: Disable</pre>

# Pg4uwMC "Search for Programmers" dialog

Search for Programmers					
Please select multiprogramming system from list bellow and click on button Search to start search for Programmers. Multiprogramming system:					
n x BeeHive204AP 🛛 🖌 🔎 Searc					
Search results:					
Programmer 1 Programmer found					
#1 BeeHive204AP s/n: 1202-00005					
Accept X Cancel I Help	]				

Dialog allows to scan all connected USB devices for programmers matching selected multiprogramming system. After finishing of scanning operation, dialog offers "Search results" list of found programmers. For some multiprogramming systems user can modify the order of Programmer Sites or delete unwanted Programmer Sites. When at least one programmer was found, button "Accept" is enabled and user can click on it to accept new settings.

### Command line parameters

Program Pg4uwMC supports following command line parameters:

#### /prj:<file\_name>

Loads project file. Parameter <file\_name> means full or relative project file path and name.

There is also available to make Load project operation from command line by entering project file name without prefix /prj:...

#### Example:

Pg4uwMC.exe c:\projects\myproject.eprj Makes load project file "c:\projects\myproject.eprj".

## Programmers supported by Pg4uwMC

The list of currently supported programmers can be displayed in Pg4uwMC by menu Help | Supported programmers. Generally, supported programmers in Pg4uwMC are 48-pin universal programmers with USB interface. Also all of our USB connected multiprogramming systems are supported. Pg4uwMC can handle from 1 to 8 programmer sites. One programmer site means one ZIF socket module.

### Troubleshooting

#### Serial numbers

For successful using of multiply programmers, correct serial numbers must be specified for each used programmer in panel Serial numbers. If there is empty field for serial number, application Pg4uw for the programmer Site won't start.

When Pg4uwMC application is searching for connected programmers in "Search for programmers" dialog, serial numbers of programmers are detected automatically. User does not need (and can not) specify serial numbers by himself.

#### Communication error(s) while searching for programmers

If some kind of communication error(s) occurs, please close all Pg4uw applications and Pg4uwMC and then start Pg4uwMC and click button "Connect programmers" to start Pg4uw applications for each Site and connect programmers.

#### All programmers are connected correctly but unstable working

If communication with programmers is lost randomly during device operation (for example device programming), please close other programs, especially programs which consumes large amount of system resources (multimedia, CAD, graphic applications and so on).

**Note:** We also recommend to use computer USB ports placed on back side of computer and directly connected to motherboard, because computer USB ports connected to computer motherboard indirectly - via cable, may be unreliable when using high speed USB 2.0 transfer modes. This recommendation is valid not only for programmers, but also for other devices.

# Common notes

# Maintenance

We recommend to follow the instructions and precautions herein to achieve high reliability of the programmer for a long period of time.

The programmer maintenance depends on character and amount of its use. Regardless, the following recommendations are generally accepted:

- Do not use and store the programmer in dusty places.
- Humidity accelerates sedimentation of debris and dust in ZIF socket.
- After end the job cover the ZIF socket.
- Do not expose the programmer to direct sunlight or position near a source of heat.

#### Intensively daily use (programming centre, production) Daily maintenance

Check the ZIF sockets of the programming module for their condition and wear. Remove debris, dust and grime from the ZIF sockets with clean, dry and compressed air. Clean the ZIF sockets both in closed and opened position.

#### Weekly maintenance

Perform the "Selftest plus" for every programmer or programming module.

#### Quarterly maintenance

Gently clean the surface of the programmer with isopropyl alcohol or technical alcohol on a soft cloth.

Perform the calibration test if the programmer supports this feature.

### Daily use (developing laboratory, office)

#### Daily maintenance

After end of the job cover the ZIF socket of the programming module. It is also recommended to protect the ZIF socket of programming modules from dust and grime.

#### Weekly maintenance

Check the ZIF socket of the programming modules for their condition and wear. Remove debris, dust and grime from the ZIF sockets with clean, dry and compressed air. Clean the ZIF sockets both in closed and opened position.

#### Quarterly maintenance

Perform the "Selftest plus" for every programmer or programming module.

#### Biannual maintenance

Gently clean the surface of the programmer with isopropyl alcohol or technical alcohol on a soft cloth.

Perform the calibration test if the programmer supports this feature.

### Occasional use

#### Daily maintenance

After end of the job cover the ZIF socket of the programming module. It is also recommended to protect the ZIF socket of programming modules from dust and grime.

#### Quarterly maintenance

Check the ZIF socket of the programming modules for their condition and wear. Remove debris, dust and grime from the ZIF sockets with clean, dry and compressed air. Clean the ZIF sockets both in closed and opened position.

#### Biannual maintenance

Perform the "Selftest plus" for every programmer or programming module.

#### Annual maintenance

Gently clean the surface of the programmer with isopropyl alcohol or technical alcohol on a soft cloth.

Perform the calibration test if the programmer supports this feature.

#### Warning:

The ZIF socket of the programming modules are considered as consumables. The life cycle of the programming module ZIF socket is generally from 5.000 to 10.000 mechanical cycles, even if the life cycle of some specialized BGA ZIF sockets can be about 500.000 mechanical cycles. Programmed devices, environment and ZIF socket maintenance have direct influence to actual electrical lifetime of ZIF socket (it means that ZIF socket does not cause programming failures yet). Keep fingers away from contacts of ZIF socket, because contacts of the ZIF socket fouled by smear and grime from fingers may cause the programming failures. Change the ZIF socket or the socket converter if you noticed increased number of programming failures.

The warranty does not apply to the ZIF sockets that are wear or grimy and which cause large amount of failures during working with programmer.

# Software

Pg4uw is common control program for all of the ELNEC programmers. Thus, during work with him it is possible to find some items, those refer not to current selected programmer.

Some special devices (e.g. Philips Coolrunner family) require external DAT files, that aren't present in standard Pg4uw SW delivery on CD. If you need to program these devices, look at <u>www.elnec.com</u>, section Download.

### Command line parameters

We recommend using special utility **Pg4uwcmd.exe** to make command line parameter control of Pg4uw. For backward compatibility there is possible to use some command line parameters also directly with **Pg4uw.exe**, but better way is to use **Pg4uwcmd.exe**, which has support of more command line commands and also it has capability to return ExitCode (or ErrorLevel) value indicating success or error result of executing command line parameters. For more information about using **Pg4uwcmd.exe** command line controller for **Pg4uw**, please take a look at **Remote command line control of Pg4uw**.

#### Command line parameters which can be used directly with Pg4uw.exe

/Prj:<file\_name> forces project load when program is starting or even if program is already running, <file\_name> means full or relative project file path and name

/Loadfile:<file\_name> forces file load when program is starting or even if program is already running, <file\_name> means full or relative path to file that has to be loaded, file format is detected automatically

Please note, the file name Windows conventions must be fulfilled. It means also, that when file name contains spaces, the command line parameter must have the file name bounded inside quotation marks.

Examples: /prj:c:\myfile.eprj

Load project file with name c:\myfile.eprj.

/loadfile:"c:\filename with spaces.bin" Load file "c:\filename with spaces.bin" to buffer.

/Program[:switch] forces start of "Program device" operation automatically when program is starting, or even if program is already running, also one of following optional switches can be used: switch 'noquest' forces start of device programming without question

switch 'noanyquest' forces start of device programming without question operation on device is completed, program doesn't show "Repeat" operation dialog and goes directly into main program window

Examples:

- 1. /Program
- 2. /Program:noquest
- 3. /Program:noanyquest

/Close

this parameter has sense together with /Program parameter only, and makes program to close automatically after device programming is finished successfully

/Close: always this parameter has sense together with /Program parameter only, and makes program to close automatically after device programming is finished, no matter if device operation was successful or not.

/Eprom\_Flash\_Autoselect[:xx]

forces automatic select EPROM or FLASH by ID when program is starting or even if program is already running. xx means pins number of device in ZIF socket (this time are valid 28 or 32 pins only) and it is required just for older programmers without insertion test capability. For others programmers is the value ignored.

Basic rules for using of executive command line parameters:

- 1. command line parameters are not case sensitive
- 2. command line parameters can be used when first starting of program or when program is already running
- 3. if program is already running, then any of command line operation is processed only when program was not busy (no operation was currently executing in program). Program must be in basic state, i.e. main program window focused, no modal dialogs displayed, no menu commands opened or executed.
- 4 order of processing command line parameters when using more parameters together is defined firmly as following:
  - 1. Load project (/Prj:...)
  - 2. Load file (/Load file:...)
  - 3. EPROM/Flash select by ID
  - 4. Program device (/Program[:switch])
  - 5. Close of control program (/Close only together with parameter /Program)

#### Available command line parameters for starting program Pg4uw in demo mode

Demo mode is useful in situations, when no programmer device is available. Demo mode can be used by clicking button Demo in dialog Find programmer or by command line parameter /demo. Recommended usage of the parameter is:

Pg4uw.exe /demo /<programmer name>

where <programmer name> has to be replaced by name of wished programmer as it is used in Pg4uw control program.

### Remote command line control of Pg4uw

Pg4uw can accept set of commands from the command line (command line parameters). The remote control can be achieved also by these command line parameters, but more efficient way is to use special tool **Pg4uwcmd.exe**, which has many advantages. The main advantage is size of the **Pg4uwcmd**, which result the calling of **Pg4uwcmd** results a much faster response than calling of **Pg4uw** directly.

Program Pg4uwcmd.exe can be used to:

- 1. start Pg4uw application with specified command line parameters
- 2. force command line parameters to Pg4uw that is already running

Very good feature of Pg4uwcmd.exe is its return code according to command line parameters operation result in Pg4uw.

#### Return values of Pg4uwcmd.exe

If the command line parameters processed in Pg4uw were successful, the ExitCode (or ErrorLevel) of Pg4uwcmd.exe is zero. Otherwise the ExitCode value is number 1 or more. Return value of program Pg4uwcmd.exe can be tested in batch files.

#### Following executive command line parameters are available to use with Pg4uwcmd.exe

/Prj: <file_name></file_name>			Loads project file. Parameter <file_name> means full or relative project file path and name</file_name>			
/Loadfile: <file_name></file_name>		ame>	Loads file. Parameter <file_name> means full or relative path to file that has to be loaded. File format is detected automatically</file_name>			
/Program[:switch]		ן]	Forces start of "Program device" operation automatically when program is starting, or even if program is already running. Also one of following optional switches can be used:			
switch 'noquest' switch 'noanyquest'		ť uesť	forces start of device programming without question forces start of device programming without question and after operation on device is completed, program doesn't show "Repeat" operation dialog and goes directly into main program window			
[	Exan	nples:				
4	4.	/Progr	am			
5. /Prog		/Progr	am:noquest			
(	6.	/Progr	gram:noanyquest			
/Close		-	This parameter has sense together with /Program parameter only, and makes program Pg4uw to close automatically after device programming is finished (no matter if operation was successful or not).			
/Saveprojec	t: <fil< td=""><td>e_nam</td><td>e&gt; ́</td></fil<>	e_nam	e> ́			

The command is used to save currently selected device type, buffer contents and configuration to project file. Command /Saveproject:... is equivalent to user selected command Save project in Pg4uw control program.

/Eprom\_Flash\_Autoselect[:xx]

Forces automatic select EPROM or FLASH type by reading of electronic ID from the chip, inserted currently in ZIF socket of programming module. Optional parameter xx means pins number of device in ZIF socket (this time are valid 28 or 32 pins only) and it is required just for older programmers without insertion test capability. For others programmers the xx parameter can be omitted, because is ignored.

#### Examples:

/Eprom\_Flash\_Autoselect

/Eprom\_Flash\_Autoselect:32

/writebuffer:ADDR1:B11,B12,B13,B14,...,B1N[::ADDR2:B21,B22,B23,B24,...,B2M]...

Command /writebuffer is used to write block of Bytes to Pg4uw main buffer at specified address. Write buffer command has one block of data required and other block(s) of data (marked with [...]) optional. Please do not use spaces or tabs in the command.

Buffer address is always defined as Byte address, it means, that for buffer organization x16, the address AAAAx16 in buffer has to be specified in command /writebuffer as 2\*AAAA (x8).

#### Example 1:

/writebuffer:7FF800:12,AB,C5,D4,7E,80

Writes 6 Bytes 12H ABH C5H D4H 7EH 80H to buffer at address 7FF800H.

The addressing looks like following:

the first Byte at the lowest address

Buffer AddressData7FF800H12H7FF801HABH7FF802HC5H

7FF803H D4H 7FF804H 7EH 7FF805H 80H

#### Example 2:

/writebuffer:7FF800:12,AB,C5,D4,7E,80::FF0000:AB,CD,EF,43,21

the first block of data the second block of data

Writes two blocks of data to buffer.

The first block of data - 6 Bytes 12H ABH C5H D4H 7EH 80H are written to buffer at address 7FF800H in the same way as in Example 1.

The second block of data - 5 Bytes ABH CDH EFH 43H 21H are written to buffer at address FF0000H.

The addressing looks like following: the first Byte at the lowest address

 Buffer Address
 Data

 FF0000H
 ABH

 FF0001H
 CDH

 FF0002H
 EFH

 FF0003H
 43H

 FF0004H
 21H

/writebufferex:INDEX:ADDR1:B11,B12,B13,B14,...,B1N[::ADDR2:B21,B22,B23,B24,...,B2M]..

Command /writebufferex is used to write block of Bytes to Pg4uw main buffer at specified address. The command is very similar to command /writebuffer, except one more parameter – INDEX.

The INDEX parameter specifies the order of buffer, where data will send. The main buffer has index '1'. The first secondary buffer has index '2', etc. Please note, the secondary buffer(s) is(are) available for some kinds of devices only (e.g. Microchip PIC16F628). The kind of buffer indexed by parameter buffindex depends on order of buffer in application Pg4uw in dialog View/Edit buffer. For example device Microchip PIC16F628 has additional buffer with label "Data EEPROM". This buffer can be accessed for data write(s) by this function when buffindex = 2 is specified.

#### Example 1:

/writebufferex:1:7FF800:12,AB,C5,D4,7E,80 The command is equivalent to command /writebuffer:1:7FF800:12,AB,C5,D4,7E,80 described in section about command /writebuffer.

#### Example 2:

/writebufferex:2:2F:12,AB,C5,D4,7E,80

The command writes 6 Bytes 12H ABH C5H D4H 7EH 80H to secondary buffer with index "2" at address 2FH. The addressing looks like following: the first Byte at the lowest address

Buffer Address Data

Dullel Aduless	Dala
00002FH	12H
000030H	ABH
000031H	C5H
000032H	D4H
000033H	7EH
000034H	80H

#### Basic rules for using of executive command line parameters:

- 1. program Pg4uwcmd.exe must be located in the same directory as program Pg4uw.exe
- 2. if Pg4uw.exe is not running when Pg4uwcmd.exe is called, it will be automatically started
- 3. command line parameters are not case sensitive
- 4. command line parameters can be used when first starting of program or when program is already running
- 5. if program is already running, then any of command line operation is processed only when program was not busy (no operation was currently executing in program). Program must be in basic state, i.e. main program window focused, no modal dialogs displayed, no menu commands opened or executed
- 6. order of processing command line parameters when using more parameters together is defined firmly as following:

step1 Load file (/Loadfile:...) step2 Load project (/Prj:...) step3 EPROM/FLASH autoselect step4 Program device (/Program[:switch]) step5 Close of control program (/Close only together with parameter /Program)

#### Example 1:

Pg4uwcmd.exe /program:noanyquest /loadfile:c:\empfile.hex Following operations will perform:

- 1. start Pg4uw.exe (if not already running)
- 2. load file c:\empfile.hex
- 3. start program device operation without questions
- 4. Pg4uwcmd.exe is still running and periodically checking status of Pg4uw.exe
- when device programming completes, Pg4uwcmd.exe is closed and is returning ExitCode depending on load file and device programming results in Pg4uw.exe. When all operations were successful, Pg4uwcmd.exe returns 0, otherwise returns value 1 or more.

#### Example 2:

Pg4uwcmd.exe /program:noanyquest /prj:c:\emproject.eprj

The operations are the same as in Example 1, just Load file operation is replaced by Load project file c:\emproject.eprj command.

#### Example 3:

Using Pq4uwcmd.exe in batch file and testing return code of Pq4uwcmd.exe. rem ------ beginning of batch -----@echo off rem Call application with wished parameters Pq4uwcmd.exe /program:noanyquest /pri:c:\emproject.epri rem Detect result of command line execution rem Variable ErrorLevel is tested, value 1 or greater means the error occurred if ErrorLevel 1 goto FAILURE echo Command line operation was successful goto BATCHEND :FAILURE echo Command line operation error(s) :BATCHEND echo echo This is end of batch file (or continue) pause rem ----- end of batch -----

#### Example 4:

Let's assume the Pg4uw control program is running, and has user selected device. We need to load required data to Pg4uw device buffer and save the selected device settings and buffer content to project file. Data required for device are stored in file c:\15001-25001\file\_10.bin. Project file will be stored at c:\projects\project\_10.eprj.

Following command line parameters should be specified to realize wished operation:

Pg4uwcmd.exe /loadfile:c:\15001-25001\file\_10.bin /saveproject:c:\projects\project\_10.eprj When Pg4uw receives the commands, it will do following procedures:

- 1. loads data file c:\15001-25001\file\_10.bin
- saves the currently selected device settings and buffer data to project file c:\projects\project\_10.eprj

If the result of operations performed is OK, Pg4uwcmd application will return ExitCode (or ErrorLevel) value 0.

If there are some errors (can not load file or save to project file), Pg4uwcmd application will return ExitCode value equal or greater than 1.

**Note:** When using the above commands, user must be sure the Pg4uw is not performing any device operation, for example device programming. If the Pg4uw is busy, it will refuse the commands and returns error status (ExitCode equal or greater than value 1).

# Hardware

Due a large variety of parallel port types, a case may occur when the programmer cannot "get concerted" with the PC. This problem may be shown as none communication between the PC and the programmer, or by unreliable communication. If this behavior occurs, try to connect your programmer to some other PCs or other parallel ports near you.

If you find none solution, please document the situation, i.e., provide us an accurate description of your PC configuration, including some other circumstances bearing on the problem in question, and advise the manufacturer of your problem. Don't forget please enter of PC type, manufacturer, speed, operation system, resident programs; your parallel port I/O manufacturer and type. Use please **Device problem report** form for this purpose.

#### Warning:

Class A ITE notice

Devices described at this manual are class A products. In domestic environment this products may cause radio interference in which case the user may be required to take adequate measures.

# ISP (In-System Programming)

## Definition

**In-system programming** allows programming and reprogramming of device positioned inside the end system. Using a simple interface, the ISP programmer communicates serially with the device, reprogramming nonvolatile memories on the chip. In-system programming eliminates the physical removal of chips from the system. This will save time and money, both during development in the lab, and when updating the software or parameters in the field.

Target device is the device (microcontroller, PLD, etc...), which is to be in-system programmed.

**Target system** is the physical Printed Circuit Board (PCB), which contains the device to be in-system programmed.

**ISP programmer** is programmer, which has in-system programming capability (for example BeeProg2AP, BeeProg+, SmartProg2, T51prog2, PIKprog2...).

### General rules for in-system programming

We recommended respect following rules to avoid damage PC, ISP programmer, and target device or target system:

- Ensure common earth point for target system, ISP programmer and PC.
- For laptop or other PC that is not connected to common earth point: make hard wired connection from laptop to common earth point (for example use LPT or COM port D – connector).
- Any devices connected to target system must be connected to common earth point too.

### Direction of connect ELNEC ISP programmer to target system:

During in-system programming you connect two electrical devices – ISP programmer and target system. Unqualified connection can damage these devices.

**Note:** When you don't keep below directions and you damage programmer during in-system programming, it is damage of programmer by unqualified manipulation and is out of warranty.

- 1. Turn off both devices ISP programmer and target device.
- 2. Assign same GND potential for all devices, e.g. connect GND of all devices by wire.
- 3.Insert one connector of ISP cable to ISP programmer, turn on programmer and control program.
- 4. In control program select target device and operation options.
- 5. Start action on target device (read, program).
- 6.After direction of control program, connect other ISP cable connector to target system and turn on it.
- 7.After direction of control program, disconnect other ISP cable connector from target system and turn off it.
- 8. If you need another action on target device, you continue with step 5.

# The recommendation for design of target system with ISP

#### programmed device

The target system must be designed to allow all signals, which are use for In-system programming to be directly connected to ISP programmer via ISP connector. If target system use these signals for other function, is necessary isolated these signals. Target system mustn't affect these signals during In-system programming.

For in-system programmable devices manufacturers publish application notes. Design of ELNEC programmers together with respect of these application notes allows proper Insystem programming. Condition is exactly respecting these application notes. Applications notes, which ELNEC use in ISP programmers, are published in <u>www.elnec.com</u>, section **Support / Application Notes**.

#### Please, read some notes for following recommended circuits.

- Purpose of D1 diode is to protect the target circuit against a higher voltage, which is provided by ISP programmer.
- If your target board supply differs from mentioned 5V, choose please the Zener diode (D1) voltage according to this supply voltage.
- We recommend to use resistors R1, R2, (R3) to separate the target device from target system. If pins needed for ISP programming are inputs in target system then separation by resistors is sufficient and resistors make a low pass filter too. If pins are outputs, then use of resistors saves a programming time. Of course the isolation resistors R1, R2, (R3) can be replaced by switches or jumpers, if necessary. In that case, during the ISP programming of target device the switches (jumpers) must be open. But the using of switches (jumpers) adds a next manipulation time to programming procedure.

#### Example of application note

#### Microcontrollers Atmel AVR and AT89Sxxx series

This interface corresponds with Atmel application note AVR910: In-System Programming. This application note describes the recommended ISP interface connector layout in target system (top view).

ELNEC recommended circuit for ATMEL AVR:

ELNEC recommended circuit for AT89Sxxx:

#### PICmicro<sup>®</sup> microcontrollers

This interface corresponds with Microchip application notes TB013, TB017, TB016: How to Implement ICSP<sup>TM</sup> Using PIC16CXXX OTP (PIC12C5XX OTP)(PIC16F8X Flash) MCUs. These application notes describes requirement for target system with In-system programming device and ISP programmer.

Following signals are use for In-system programming of PICmicro<sup>®</sup> microcontrollers.

- MCLR\ / VPP reset / switch to programming mode
- RB6 (GP1) clock
- RB7 (GP0) data input / output
- VDD power supply
- GND ground

When PICmicro<sup>®</sup> device is programmed, pin MCLR\ / VPP is driven to approximately 12 V. Therefore, the target system must be isolated from this voltage provided by programmer.

RB6 and RB7 signals are used by the PICmicro<sup>®</sup> for In-system programming, therefore target system mustn't affect these signals during In-system programming to avoid programming errors.

Marginal verify is used after programming. Programmer must verify the program memory contents at both minimal and maximal power supply, therefore VDD pin of PICmicro<sup>®</sup> must be isolated from rest of target system during programming.

ELNEC recommended circuit for PICmicro:

Note: External reset circuit is necessary only if VDD power-up slope is too slow.

# Other

Please don't move **Info** window during BUSY LED is on - watching circuit can be activate to switch the programmer in safe status as in case communication PC-programmer error.

# Troubleshooting and warranty

# Troubleshooting

We really want you to enjoy our product. Nevertheless, problems can occur. In such cases please follow the instructions below.

- It might be your mistake in properly operating the programmer or its control program Pg4uw.
  - Please read carefully all the enclosed documentation again. Probably you will find the needed answer right away.
  - Try to install programmer and Pg4uw on another computer. If your system works normally on the other computer you might have a problem with the first one PC. Compare differences between both computers.
  - Ask your in-house guru (every office has one!).
  - Ask the person who already installed programmer.
- If the problem persists, please call the local dealer, from whom you purchased the programmer, or call ELNEC direct. Most problems can be solved by phone, e-mail or fax. If you want to contact us by:
  - Mail/fax Copy the "DEVICE PROBLEM REPORT" form and fill it in following the instructions at the end of the form. Write everything down that you consider being relevant about the programmer, software and the target device. Send the completed form by mail or fax to ELNEC (fax number in the control program, menu Help / About) or to your local dealer. If you send the form by fax please use black ink, a good pen and large letters!
  - E-mail Use "DEVICE PROBLEM REPORT" form on the CD or from our Internet site and fill it in following the instructions at the end of the form. Use standard ASCII editor. Write everything down that you consider being relevant about the programmer, software and the target device. Send the completed form by e-mail to your local dealer or to ELNEC ((nospam version) elnec at elnec dot com).
  - Phone Copy "DEVICE PROBLEM REPORT" form and fill it in following the instructions at the end of the form. Write everything down that you consider being relevant about the programmer, software and the target device. Send the completed form by mail or fax to ELNEC (fax number in the control program, menu Help / About) or to your local dealer. If you send the form by fax please use black ink, a good pen and large letters easily to read. Then call your local dealer or ELNEC customer support center (phone number in the control program, menu Help / About). Please keep your manual, the programmer and the completed "DEVICE PROBLEM REPORT" form (just faxed) available, so that you can respond quickly to our questions.
- If your programmer is diagnosed as defective, consult your local dealer or ELNEC about the pertinent repair center in your country. Please carefully include the following items in the package:
  - defective product
  - completed "DEVICE PROBLEM REPORT" form
  - photocopy of a dated proof of purchase

Without all these items we cannot admit your programmer to repair.

#### Note:

You may find the "DEVICE PROBLEM REPORT" form:

• at our Internet site (www.elnec.com), section Support / Problem report.

# If you have an unsupported target device

If you need to operate on a target device not supported by the control program for programmer, please do not despair and follow the next steps:

- Look in the device list of the latest version of the control program on our Internet site (section Download, file corresponded to your programmer). Your new target device might already be included in this version! If yes, download the file Pg4uwARC.exe and install the new version of the control program.
- Contact ELNEC direct, filling up a "Device Problem Report" form following the instructions at the end of this form. We may need detailed data sheets of your target device and, if possible, samples. The samples will be returned to you after we include your target device in a new version of Pg4uw.

# Warranty terms

The manufacturer, ELNEC s.r.o. Presov, Slovakia, gives a guarantee on failure-free operating of the programmer and all its parts, materials and workmanship for **three-year** (BeeHive204AP and BeeProg2AP) from the date of purchase. This warranty is limited to 500 insertion of programming module to Programming Module Interface connectors. If the product is diagnosed as defective, ELNEC s.r.o. or the authorized repair center will repair or replace defective parts at no charge. Parts used for replacement and/or whole programmer are warranted only for the reminder of the original warranty period.

For repair within the warranty period, the customer must prove the date of purchase.

This warranty terms are valid for customers, who purchase a programmer directly from Elnec company. The warranty conditions of Elnec sellers may differ depending on the target country law system or Elnec seller's warranty policy.

The warranty does not apply to products that are of wear and tear or mechanically damaged. Equally, the warranty does not apply to products opened and/or repaired and/or altered by personnel not authorized by ELNEC, or to products that have been misused, abused, accidentated or that were improperly installed.

For unwarrantable repairs you will be billed according to the costs of replacement materials, service time and freight. ELNEC or its distributors will determine whether the defective product should be repaired or replaced and judge whether or not the warranty applies.

Manufacturer: ⊠: ELNEC s. r. o., Jana Bottu 5, SK - 08001 Presov, Slovakia ☎: +42151/77 34 328, 77 31 007, fax 77 32 797 www.elnec.com, e-mail (nospam version): elnec at elnec dot com

ELNEC has used its best efforts to develop hardware and software that is stable and reliable. ELNEC does not guarantee that the hardware and software are free of "bugs", errors or defects. ELNEC's liability is always limited to contract's net value paid by a buyer.

ELNEC is not liable for:

- Damage caused by inappropriate use or handling of products.
- Damage caused by users or third parties modifying or trying to modify products.
- Any further damage or consequent damage caused by hardware errors or software "bugs".

**For example:** lost profits, lost savings, damages arised from claims of third parties against a client, damage or loss of recorded data or files, renown, loss caused by impossibility to use etc.
